

NOTATION

The following is a list of acronyms and abbreviations, chemical names, and units of measure used in this document. Some acronyms used only in tables may be defined only in those tables.

GENERAL ACRONYMS AND ABBREVIATIONS

10	AADT	annual average daily traffic
11	AASHTO	American Association of State Highway and Transportation Officials
12	AC	alternating current
13	ACC	air-cooled condenser
14	ACEC	Area of Critical Environmental Concern
15	ADEQ	Arizona Department of Environmental Quality
16	ACHP	Advisory Council on Historic Preservation
17	ADOT	Arizona Department of Transportation
18	ADWR	Arizona Department of Water Resources
19	AERMOD	AMS/EPA Regulatory Model
20	AFC	Application for Certification
21	AGL	above ground level
22	AIM	Assessment, Inventory and Monitoring
23	AIRFA	American Indian Religious Freedom Act
24	AMA	active management area
25	AML	animal management level
26	ANHP	Arizona National Heritage Program
27	APE	area of potential effect
28	APLIC	Avian Power Line Interaction Committee
29	APP	Avian Protection Plan
30	APS	Arizona Public Service
31	AQCR	Air Quality Control Region
32	AQRV	air quality-related value
33	ARB	Air Resources Board
34	ARRA	American Recovery and Reinvestment Act of 2009
35	ARRTIS	Arizona Renewable Resource and Transmission Identification Subcommittee
36	ARS	Agricultural Research Service
37	ARZC	Arizona and California
38	ATSDR	Agency for Toxic Substances and Disease Registry
39	AUM	animal unit month
40	AVSE	Arlington Valley Solar Energy
41	AVWS	Audio Visual Warning System
42	AWBA	Arizona Water Banking Authority
43	AWEA	American Wind Energy Association
44	AWRM	Active Water Resource Management
45	AZDA	Arizona Department of Agriculture
46	AZGFD	Arizona Game and Fish Department

1	AZGS	Arizona Geological Survey
2		
3	BA	biological assessment
4	BAP	base annual production
5	BEA	Bureau of Economic Analysis
6	BISON-M	Biota Information System of New Mexico
7	BLM	Bureau of Land Management
8	BLM-CA	Bureau of Land Management, California
9	BMP	best management practice
10	BNSF	Burlington Northern Santa Fe
11	BO	biological opinion
12	BOR	U.S. Bureau of Reclamation
13	BPA	Bonneville Power Administration
14	BRAC	Blue Ribbon Advisory Council on Climate Change
15	BSE	Beacon Solar Energy
16	BSEP	Beacon Solar Energy Project
17	BTS	Bureau of Transportation Statistics
18		
19	CAA	Clean Air Act
20	CAAQS	California Air Quality Standards
21	CAISO	California Independent System Operator
22	Caltrans	California Department of Transportation
23	C-AMA	California-Arizona Maneuver Area
24	CAP	Central Arizona Project
25	CARB	California Air Resources Board
26	CAReGAP	California Regional Gap Analysis Project
27	CASQA	California Stormwater Quality Association
28	CASTNET	Clean Air Status and Trends NETwork
29	CAWA	Colorado Agricultural Water Alliance
30	CCC	Civilian Conservation Corps
31	CDC	Centers for Disease Control and Prevention
32	CDCA	California Desert Conservation Area
33	CDFG	California Department of Fish and Game
34	CDNCA	California Desert National Conservation Area
35	CDOT	Colorado Department of Transportation
36	CDOW	Colorado Division of Wildlife (now Colorado Parks and Wildlife)
37	CDPHE	Colorado Department of Public Health and Environment
38	CDWR	California Department of Water Resources
39	CEC	California Energy Commission
40	CEQ	Council on Environmental Quality
41	CES	constant elasticity of substitution
42	CESA	California Endangered Species Act
43	CESF	Carrizo Energy Solar Farm
44	CFR	<i>Code of Federal Regulations</i>
45	CGE	computable general equilibrium
46	CHAT	crucial habitat assessment tool

1	CIRA	Cooperative Institute for Research in the Atmosphere
2	CLFR	compact linear Fresnel reflector
3	CNDDDB	California Natural Diversity Database
4	CNEL	community noise equivalent level
5	CNHP	Colorado National Heritage Program
6	Colorado DWR	Colorado Division of Water Resources
7	CO ₂ e	carbon dioxide equivalent
8	CPC	Center for Plant Conservation
9	CPUC	California Public Utilities Commission
10	CPV	concentrating photovoltaic
11	CRBSCF	Colorado River Basin Salinity Control Forum
12	CREZ	competitive renewable energy zone
13	CRPC	Cultural Resources Preservation Council
14	CRSCP	Colorado River Salinity Control Program
15	CSA	Candidate Study Area
16	CSC	Coastal Services Center
17	CSFG	carbon-sequestration fossil generation
18	CSP	concentrating solar power
19	CSQA	California Stormwater Quality Association
20	CSRI	Cultural Systems Research, Incorporated
21	CTG	combustion turbine generator
22	CTPG	California Transmission Planning Group
23	CTSR	Cumbres & Toltec Scenic Railroad
24	CUP	Conditional Use Permit
25	CVP	Central Valley Project
26	CWA	Clean Water Act
27	CWCB	Colorado Water Conservation Board
28	CWHR	California Wildlife Habitat Relationship System
29		
30	DC	direct current
31	DEM	digital elevation model
32	DHS	U.S. Department of Homeland Security
33	DIMA	Database for Inventory, Monitoring and Assessment
34	DLT	dedicated-line transmission
35	DNA	Determination of NEPA Adequacy
36	DNI	direct normal insulation
37	DNL	day-night average sound level
38	DoD	U.S. Department of Defense
39	DOE	U.S. Department of Energy
40	DOI	U.S. Department of the Interior
41	DOL	U.S. Department of Labor
42	DOT	U.S. Department of Transportation
43	DRECP	California Desert Renewable Energy Conservation Plan
44	DSM	demand-side management
45	DSRP	Decommissioning and Site Reclamation Plan
46	DTC/C-AMA	Desert Training Center/California–Arizona Maneuver Area

1	DWMA	Desert Wildlife Management Area
2	DWR	Division of Water Resources
3		
4	EA	environmental assessment
5	EBID	Elephant Butte Irrigation District
6	ECAR	East Central Area Reliability Coordination Agreement
7	ECOS	Environmental Conservation Online System (USFWS)
8	EERE	Energy Efficiency and Renewable Energy (DOE)
9	Eg	band gap energy
10	EIA	Energy Information Administration (DOE)
11	EIS	environmental impact statement
12	EISA	Energy Independence and Security Act of 2007
13	EMF	electromagnetic field
14	E.O.	Executive Order
15	EPA	U.S. Environmental Protection Agency
16	EPRI	Electric Power Research Institute
17	EQIP	Environmental Quality Incentives Program
18	ERCOT	Electric Reliability Council of Texas
19	ERO	Electric Reliability Organization
20	ERS	Economic Research Service
21	ESA	Endangered Species Act of 1973
22	ESRI	Environmental Systems Research Institute
23		
24	FAA	Federal Aviation Administration
25	FBI	Federal Bureau of Investigation
26	FEMA	Federal Emergency Management Agency
27	FERC	Federal Energy Regulatory Commission
28	FHWA	Federal Highway Administration
29	FIRM	Flood Insurance Rate Map
30	FLPMA	Federal Land Policy and Management Act of 1976
31	FONSI	Finding of No Significant Impact
32	FR	<i>Federal Register</i>
33	FRCC	Florida Reliability Coordinating Council
34	FSA	Final Staff Assessment
35	FTE	full-time equivalent
36	FY	fiscal year
37		
38	G&TM	generation and transmission modeling
39	GCRP	U.S. Global Climate Research Program
40	GDA	generation development area
41	GHG	greenhouse gas
42	GIS	geographic information system
43	GMU	game management unit
44	GPS	global positioning system
45	GTM	Generation and Transmission Model
46		

1	GUAC	Groundwater Users Advisory Council
2	GWP	global warming potential
3		
4	HA	herd area
5	HAP	hazardous air pollutant
6	HAZCOM	hazard communication
7	HCE	heat collection element
8	HCP	Habitat Conservation Plan
9	HMA	herd management area
10	HMMH	Harris Miller Miller & Hanson, Inc.
11	HRSG	heat recovery steam generator
12	HSPD	Homeland Security Presidential Directive
13	HTF	heat transfer fluid
14	HUC	hydrologic unit code
15	HVAC	heating, ventilation, and air-conditioning
16		
17	I	Interstate
18	IARC	International Agency for Research on Cancer
19	IBA	important bird area
20	ICE	internal combustion engine
21	ICPDS	Imperial County Planning & Development Services
22	ICWMA	Imperial County Weed Management Area
23	IDT	interdisciplinary team
24	IEC	International Electrochemical Commission
25	IFR	instrument flight rule
26	IID	Imperial Irrigation District
27	IM	Instruction Memorandum
28	IMPS	Iron Mountain Pumping Station
29	IMS	interim mitigation strategy
30	INA	Irrigation Non-Expansion Area
31	IOP	Interagency Operating Procedure
32	IOU	investor-owned utility
33	IPCC	Intergovernmental Panel on Climate Change
34	ISA	Independent Science Advisor; Instant Study Area
35	ISB	Intermontane Seismic Belt
36	ISCC	integrated solar combined cycle
37	ISDRA	Imperial Sand Dunes Recreation Area
38	ISEGS	Ivanpah Solar Energy Generating System
39	ISO	independent system operator; iterative self-organizing
40	ITFR	Interim Temporary Final Rulemaking
41	ITP	incidental take permit
42	IUCNNR	International Union for Conservation of Nature and Natural Resources
43	IUCNP	International Union for Conservation of Nature Pakistan
44		
45	KGA	known geothermal resources area
46	KML	keyhole markup language

1	KOP	key observation point
2	KSLA	known sodium leasing area
3		
4	LCC	Landscape Conservation Cooperative
5	LCCRDA	Lincoln County Conservation, Recreation, and Development Act of 2004
6	LCOE	levelized cost of energy
7	L _{dn}	day-night average sound level
8	LDWMA	Low Desert Weed Management Area
9	L _{eq}	equivalent sound pressure level
10	LiDAR	light detection and ranging
11	LLA	limited land available
12	LLRW	low-level radioactive waste (waste classification)
13	LPN	listing priority number
14	LRG	Lower Rio Grande
15	LSA	lake and streambed alteration
16	LSE	load-serving entity
17	LTMP	long-term monitoring and adaptive management plan
18	LTVA	long-term visitor area
19		
20	MAAC	Mid-Atlantic Area Council
21	MAIN	Mid-Atlantic Interconnected Network
22	MAPP	methyl acetylene propadiene stabilizer; Mid-Continent Area Power Pool
23	MCAS	Marine Corps Air Station
24	MCL	maximum contaminant level
25	MEB	Marine Expeditionary Brigade
26	MFP	Management Framework Plan
27	MIG	Minnesota IMPLAN Group
28	MLA	maximum land available
29	MOA	military operating area
30	MOU	Memorandum of Understanding
31	MPDS	maximum potential development scenario
32	MRA	Multiple Resource Area
33	MRI	Midwest Research Institute
34	MRO	Midwest Reliability Organization
35	MSDS	Material Safety Data Sheet
36	MSL	mean sea level
37	MTR	military training route
38	MVEDA	Mesilla Valley Economic Development Alliance
39	MWA	Mojave Water Agency
40	MWD	Metropolitan Water District
41	MWMA	Mojave Weed Management Area
42	NAAQS	National Ambient Air Quality Standard(s)
43	NADP	National Atmospheric Deposition Program
44	NAGPRA	Native American Graves Protection and Repatriation Act
45	NAHC	Native American Heritage Commission (California)
46	NAIC	North American Industrial Classification System

1	NASA	National Aeronautics and Space Administration
2	NCA	National Conservation Area
3	NCCAC	Nevada Climate Change Advisory Committee
4	NCDC	National Climatic Data Center
5	NCES	National Center for Education Statistics
6	NDAA	National Defense Authorization Act
7	NDCNR	Nevada Department of Conservation and Natural Resources
8	NDEP	Nevada Division of Environmental Protection
9	NDOT	Nevada Department of Transportation
10	NDOW	Nevada Department of Wildlife
11	NDWP	Nevada Division of Water Planning
12	NDWR	Nevada Division of Water Resources
13	NEAP	Natural Events Action Plan
14	NEC	National Electric Code
15	NED	National Elevation Database
16	NEP	Natural Events Policy
17	NEPA	National Environmental Policy Act of 1969
18	NERC	North American Electricity Reliability Corporation
19	NGO	non-governmental organization
20	NHA	National Heritage Area
21	NHD	National Hydrography Dataset
22	NHNM	National Heritage New Mexico
23	NHPA	National Historic Preservation Act of 1966
24	NID	National Inventory of Dams
25	NLCS	National Landscape Conservation System
26	NMAC	<i>New Mexico Administrative Code</i>
27	NMBGMR	New Mexico Bureau of Geology and Mineral Resources
28	NMDGF	New Mexico Department of Game and Fish
29	NM DOT	New Mexico Department of Transportation
30	NMED	New Mexico Environment Department
31	NMED-AQB	New Mexico Environment Department-Air Quality Board
32	NMFS	National Marine Fisheries Service
33	NMOSE	New Mexico Office of the State Engineer
34	NMSU	New Mexico State University
35	NNHP	Nevada Natural Heritage Program
36	NNL	National Natural Landmark
37	NNSA	National Nuclear Security Administration
38	NOA	Notice of Availability
39	NOAA	National Oceanic and Atmospheric Administration
40	NOI	Notice of Intent
41	NP	National Park
42	NPDES	National Pollutant Discharge Elimination System
43	NPL	National Priorities List
44	NPS	National Park Service
45	NPV	net present value
46	NRA	National Recreation Area

1	NRCS	Natural Resources Conservation Service
2	NREL	National Renewable Energy Laboratory
3	NRHP	<i>National Register of Historic Places</i>
4	NRS	<i>Nevada Revised Statutes</i>
5	NSC	National Safety Council
6	NSO	no surface occupancy
7	NSTC	National Science and Technology Council
8	NTHP	National Trust for Historic Preservation
9	NTS	Nevada Test Site
10	NTTR	Nevada Test and Training Range
11	NVCRS	Nevada Cultural Resources Inventory System
12	NV DOT	Nevada Department of Transportation
13	NWCC	National Wind Coordinating Committee
14	NWI	National Wetlands Inventory
15	NWIS	National Water Information System (USGS)
16	NWPP	Northwest Power Pool
17	NWR	National Wildlife Refuge
18	NWSRS	National Wild and Scenic River System
19		
20	O&M	operation and maintenance
21	ODFW	Oregon Department of Fish and Wildlife
22	OHV	off-highway vehicle
23	ONA	Outstanding Natural Area
24	ORC	organic Rankine cycle
25	OSE/ISC	Office of the State Engineer/Interstate Stream Commission
26	OSHA	Occupational Safety and Health Administration
27	OTA	Office of Technology Assessment
28		
29	PA	Programmatic Agreement
30	PAD	Preliminary Application Document
31	PAH	polycyclic aromatic hydrocarbon
32	PAT	peer analysis tool
33	PCB	polychlorinated biphenyl
34	PCM	purchase change material
35	PCS	power conditioning system
36	PCU	power converting unit
37	PEIS	programmatic environmental impact statement
38	PFYC	potential fossil yield classification
39	PGH	Preliminary General Habitat
40	PIER	Public Interest Energy Research
41	P.L.	Public Law
42	PLSS	Public Land Survey System
43	PM	particulate matter
44	PM _{2.5}	particulate matter with a diameter of 2.5 µm or less
45	PM ₁₀	particulate matter with a diameter of 10 µm or less
46	PPA	Power Purchase Agreement

1	P-P-D	population-to-power density
2	PPH	Preliminary Priority Habitat
3	POD	plan of development
4	POU	publicly owned utility
5	PPA	Power Purchase Agreement
6	PPE	personal protective equipment
7	PSD	Prevention of Significant Deterioration
8	PURPA	Public Utility Regulatory Policy Act
9	PV	photovoltaic
10	PVID	Palo Verde Irrigation District
11	PWR	public water reserve
12		
13	QRA	qualified resource area
14		
15	R&I	relevance and importance
16	RAC	Resource Advisory Council
17	RCE	Reclamation Cost Estimate
18	RCI	residential, commercial, and industrial (sector)
19	RCRA	Resource Conservation and Recovery Act of 1976
20	RD&D	research, development, and demonstration; research, development, and
21		deployment
22	RDBMS	Relational Database Management System
23	RDEP	Restoration Design Energy Project
24	REA	Rapid Ecoregional Assessment
25	REAT	Renewable Energy Action Team
26	REDA	Renewable Energy Development Area
27	REDI	Renewable Energy Development Infrastructure
28	REEA	Renewable Energy Evaluation Area
29	ReEDS	Regional Energy Deployment System
30	REPG	Renewable Energy Policy Group
31	RETA	Renewable Energy Transmission Authority
32	RETAAC	Renewable Energy Transmission Access Advisory Committee
33	RETI	Renewable Energy Transmission Initiative
34	REZ	renewable energy zone
35	RF	radio frequency
36	RFC	Reliability First Corporation
37	RFDS	reasonably foreseeable development scenario
38	RGP	Rio Grande Project
39	RGWCD	Rio Grande Water Conservation District
40	RMP	Resource Management Plan
41	RMPA	Rocky Mountain Power Area
42	RMZ	Resource Management Zone
43	ROD	Record of Decision
44	ROI	region of influence
45	ROS	recreation opportunity spectrum
46	ROW	right-of-way

1	RPG	renewable portfolio goal
2	RPS	Renewable Portfolio Standard
3	RRC	Regional Reliability Council
4	RSEP	Rice Solar Energy Project
5	RSI	Renewable Systems Interconnection
6	RTO	regional transmission organization
7	RTTF	Renewable Transmission Task Force
8	RV	recreational vehicle
9		
10	SAAQS	State Ambient Air Quality Standard(s)
11	SAMHSA	Substance Abuse and Mental Health Services Administration
12	SCADA	supervisory control and data acquisition
13	SCE	Southern California Edison
14	SCRMA	Special Cultural Resource Management Area
15	SDRREG	San Diego Regional Renewable Energy Group
16	SDWA	Safe Drinking Water Act of 1974
17	SEGIS	Solar Energy Grid Integration System
18	SEGS	Solar Energy Generating System
19	SEI	Sustainable Energy Ireland
20	SEIA	Solar Energy Industrial Association
21	SES	Stirling Energy Systems
22	SETP	Solar Energy Technologies Program (DOE)
23	SEZ	solar energy zone
24	SHPO	State Historic Preservation Office(r)
25	SIP	State Implementation Plan
26	SLRG	San Luis & Rio Grande
27	SMA	Special Management Area
28	SMART	specific, measurable, achievable, relevant, and time sensitive
29	SMP	suggested management practice
30	SNWA	Southern Nevada Water Authority
31	SPP	Southwest Power Pool
32	SRMA	Special Recreation Management Area
33	SSA	Socorro Seismic Anomaly
34	SSI	self-supplied industry
35	ST	solar thermal
36	STG	steam turbine generator
37	SUA	special use airspace
38	SWAT	Southwest Area Transmission
39	SWIP	Southwest Intertie Project
40	SWPPP	Stormwater Pollution Prevention Plan
41	SWReGAP	Southwest Regional Gap Analysis Project
42		
43	TAP	toxic air pollutant
44	TCC	Transmission Corridor Committee
45	TDS	total dissolved solids
46	TEPPC	Transmission Expansion Planning Policy Committee

1	TES	thermal energy storage
2	TRACE	Transmission Routing and Configuration Estimator
3	TSA	Transportation Security Administration
4	TSCA	Toxic Substances Control Act of 1976
5	TSDF	treatment, storage, and disposal facility
6	TSP	total suspended particulates
7		
8	UACD	Utah Association of Conservation Districts
9	UBWR	Utah Board of Water Resources
10	UDA	Utah Department of Agriculture
11	UDEQ	Utah Department of Environmental Quality
12	UDNR	Utah Department of Natural Resources
13	UDOT	Utah Department of Transportation
14	UDWQ	Utah Division of Water Quality
15	UDWR	Utah Division of Wildlife Resources
16	UGS	Utah Geological Survey
17	UNEP	United Nations Environmental Programme
18	UNPS	Utah Native Plant Society
19	UP	Union Pacific
20	UREZ	Utah Renewable Energy Zone
21	USACE	U.S. Army Corps of Engineers
22	USAF	U.S. Air Force
23	USC	<i>United States Code</i>
24	USDA	U.S. Department of Agriculture
25	USFS	U.S. Forest Service
26	USFWS	U.S. Fish and Wildlife Service
27	USGS	U.S. Geological Survey
28	Utah DWR	Utah Division of Water Rights
29	UTTR	Utah Test and Training Range
30	UWS	Underground Water Storage, Savings and Replenishment Act
31		
32	VACAR	Virginia–Carolinas Subregion
33	VCRS	Visual Contrast Rating System
34	VFR	visual flight rule
35	VOC	volatile organic compound
36	VRHCRP	Virgin River Habitat Conservation & Recovery Program
37	VRI	Visual Resource Inventory
38	VRM	Visual Resource Management
39		
40	WA	Wilderness Area
41	WECC	Western Electricity Coordinating Council
42	WECC CAN	Western Electricity Coordinating Council–Canada
43	WEG	wind erodibility group
44	Western	Western Area Power Administration
45	WGA	Western Governors’ Association
46	WGFD	Wyoming Game and Fish Department

1	WHA	wildlife habitat area
2	WHO	World Health Organization
3	WIA	Wyoming Infrastructure Authority
4	WRAP	Water Resources Allocation Program; Western Regional Air Partnership
5	WRCC	Western Regional Climate Center
6	WREZ	Western Renewable Energy Zones
7	WRI	Water Resources Research Institute
8	WSA	Wilderness Study Area
9	WSC	wildlife species of special concern
10	WSMR	White Sands Missile Range
11	WSR	Wild and Scenic River
12	WSRA	Wild and Scenic Rivers Act of 1968
13	WWII	World War II
14	WWP	Western Watersheds Project
15		
16	YPG	Yuma Proving Ground
17		
18	ZITA	zone identification and technical analysis
19	ZLD	zero liquid discharge

20
21

22 **CHEMICALS**

23				
24	CH ₄	methane	NO ₂	nitrogen dioxide
25	CO	carbon monoxide	NO _x	nitrogen oxides
26	CO ₂	carbon dioxide		
27			O ₃	ozone
28	H ₂ S	hydrogen sulfide		
29	Hg	mercury	Pb	lead
30				
31	N ₂ O	nitrous oxide	SF ₆	sulfur hexafluoride
32	NH ₃	ammonia	SO ₂	sulfur dioxide
			SO _x	sulfur oxides

33
34

35 **UNITS OF MEASURE**

36				
37	ac-ft	acre-foot (feet)	dB	A-weighted decibel(s)
38	bhp	brake horsepower		
39			°F	degree(s) Fahrenheit
40	°C	degree(s) Celsius	ft	foot (feet)
41	cf	cubic foot (feet)	ft ²	square foot (feet)
42	cfs	cubic foot (feet) per second	ft ³	cubic foot (feet)
43	cm	centimeter(s)		
44			g	gram(s)
45	dB	decibel(s)	gal	gallon(s)

1	GJ	gigajoule(s)	MWe	megawatt(s) electric
2	gpcd	gallon per capita per day	MWh	megawatt-hour(s)
3	gpd	gallon(s) per day		
4	gpm	gallon(s) per minute	ppm	part(s) per million
5	GW	gigawatt(s)	psi	pound(s) per square inch
6	GWh	gigawatt hour(s)	psia	pound(s) per square inch absolute
7	GWh/yr	gigawatt hour(s) per year		
8			rpm	rotation(s) per minute
9	h	hour(s)		
10	ha	hectare(s)	s	second(s)
11	Hz	hertz	scf	standard cubic foot (feet)
12				
13	in.	inch(es)	TWh	terawatt hour(s)
14				
15	J	joule(s)	VdB	vibration velocity decibel(s)
16				
17	K	degree(s) Kelvin	W	watt(s)
18	kcal	kilocalorie(s)		
19	kg	kilogram(s)	yd ²	square yard(s)
20	kHz	kilohertz	yd ³	cubic yard(s)
21	km	kilometer(s)	yr	year(s)
22	km ²	square kilometer(s)		
23	kPa	kilopascal(s)	µg	microgram(s)
24	kV	kilovolt(s)	µm	micrometer(s)
25	kVA	kilovolt-ampere(s)		
26	kW	kilowatt(s)		
27	kWh	kilowatt-hour(s)		
28	kWp	kilowatt peak		
29				
30	L	liter(s)		
31	lb	pound(s)		
32				
33	m	meter(s)		
34	m ²	square meter(s)		
35	m ³	cubic meter(s)		
36	mg	milligram(s)		
37	Mgal	million gallons		
38	mi	mile(s)		
39	mi ²	square mile(s)		
40	min	minute(s)		
41	mm	millimeter(s)		
42	MMt	million metric ton(s)		
43	MPa	megapascal(s)		
44	mph	mile(s) per hour		
45	MVA	megavolt-ampere(s)		
46	MW	megawatt(s)		

1 **10 UPDATE TO AFFECTED ENVIRONMENT AND IMPACT ASSESSMENT**
2 **FOR PROPOSED SOLAR ENERGY ZONES IN COLORADO**
3
4

5 The U.S. Department of the Interior Bureau of Land Management (BLM) has carried
6 17 solar energy zones (SEZs) forward for analysis in this Final Solar Programmatic
7 Environmental Impact Statement (PEIS). These SEZs total approximately 285,000 acres
8 (1,153 km²) of land potentially available for development. This chapter includes analyses of
9 potential environmental impacts for the proposed SEZs in Colorado—Antonito Southeast,
10 De Tilla Gulch, Fourmile East, and Los Mogotes East. The SEZ-specific analyses provide
11 documentation from which the BLM will tier future project authorizations, thereby limiting the
12 required scope and effort of project-specific National Environmental Policy Act of 1969 (NEPA)
13 analyses.
14

15 The BLM is committed to collecting additional SEZ-specific resource data and
16 conducting additional analysis in order to more efficiently facilitate future development in
17 SEZs. The BLM developed action plans for each of the 17 SEZs carried forward as part of
18 the Supplement to the Draft Solar PEIS (BLM and DOE 2011). These action plans described
19 additional data that could be collected for individual SEZs and proposed data sources and
20 methods for the collection of those data. Work is under way to collect additional data as
21 specified under these action plans (e.g., additional data collection to support evaluation of
22 cultural, visual, and water resources has begun). As the data become available, they will be
23 posted on the project Web site (<http://solareis.anl.gov>) for use by applicants and the BLM and
24 other agency staff.
25

26 To accommodate the flexibility described in the BLM’s program objectives and in light
27 of anticipated changes in technologies and environmental conditions over time, the BLM has
28 removed some of the prescriptive SEZ-specific design features presented in the Draft Solar PEIS
29 (BLM and DOE 2010) and the Supplement to the Draft (e.g., height restrictions on technologies
30 used to address visual resource impacts). Alternatively, the BLM will give full consideration to
31 any outstanding conflicts in SEZs as part of the competitive process being developed through
32 rulemaking (see Section 2.2.2.2.1).
33

34 In preparing selected parcels for competitive offer, the BLM will review all existing
35 analysis for an SEZ and consider any new or changed circumstances that may affect the
36 development of the SEZ. The BLM will also work with appropriate federal, state, and local
37 agencies, and affected tribes, as necessary, to discuss SEZ-related issues. This work would
38 ultimately inform how a parcel would be offered competitively (e.g., parcel size and
39 configuration, technology limitations, mitigation requirements, and parcel-specific competitive
40 process). Prior to issuing a notice of competitive offer, the BLM would complete appropriate
41 NEPA analysis to support the offer. This analysis would tier to the analysis for SEZs in the Solar
42 PEIS to the extent practicable.
43

44 It is the BLM’s goal to compile all data, information, and analyses for SEZs from the
45 Draft Solar PEIS, the Supplement to the Draft, and this Final PEIS into a single location

1 accessible via the project Web site (<http://solareis.anl.gov>) for ease of use by applicants and the
2 BLM and other agency staff.
3

4 This chapter is an update to the information on Colorado SEZs presented in the Draft
5 Solar PEIS. The information presented in this chapter supplements and updates, but does not
6 replace, the information provided in the corresponding Chapter 10 on proposed SEZs in
7 Colorado in the Draft Solar PEIS. Corrections to incorrect information in Sections 10.1, 10.2,
8 10.3, and 10.4 of the Draft Solar PEIS and in Sections C.3.1, C.3.2, C.3.3, and C.3.4 of the
9 Supplement to the Draft are provided in Sections 10.1.26, 10.2.26, 10.3.26, and 10.4.26 of this
10 Final Solar PEIS.

1 **10.4 LOS MOGOTES EAST**

2
3
4 **10.4.1 Background and Summary of Impacts**

5
6
7 **10.4.1.1 General Information**

8
9 The proposed Los Mogotes East SEZ is located in Conejos County in south-central
10 Colorado, about 12 mi (19 km) north of the New Mexico border. In 2008, the county population
11 was 8,745, while the four-county region surrounding the SEZ—Alamosa, Conejos, Costilla, and
12 Rio Grande Counties—had a total population of 39,759. The largest nearby town is Alamosa,
13 which had a 2008 population of 8,745 and is located about 22 mi (35 km) to the northeast on
14 U.S. 285. This highway is located about 3 mi (5 km) east of the SEZ. The town of Romeo is
15 located about 3 mi (5 km) directly to the east of the SEZ on U.S. 285. The SLRG Railroad serves
16 the area. As of October 28, 2011, there were no pending solar project applications within or
17 adjacent to the SEZ.

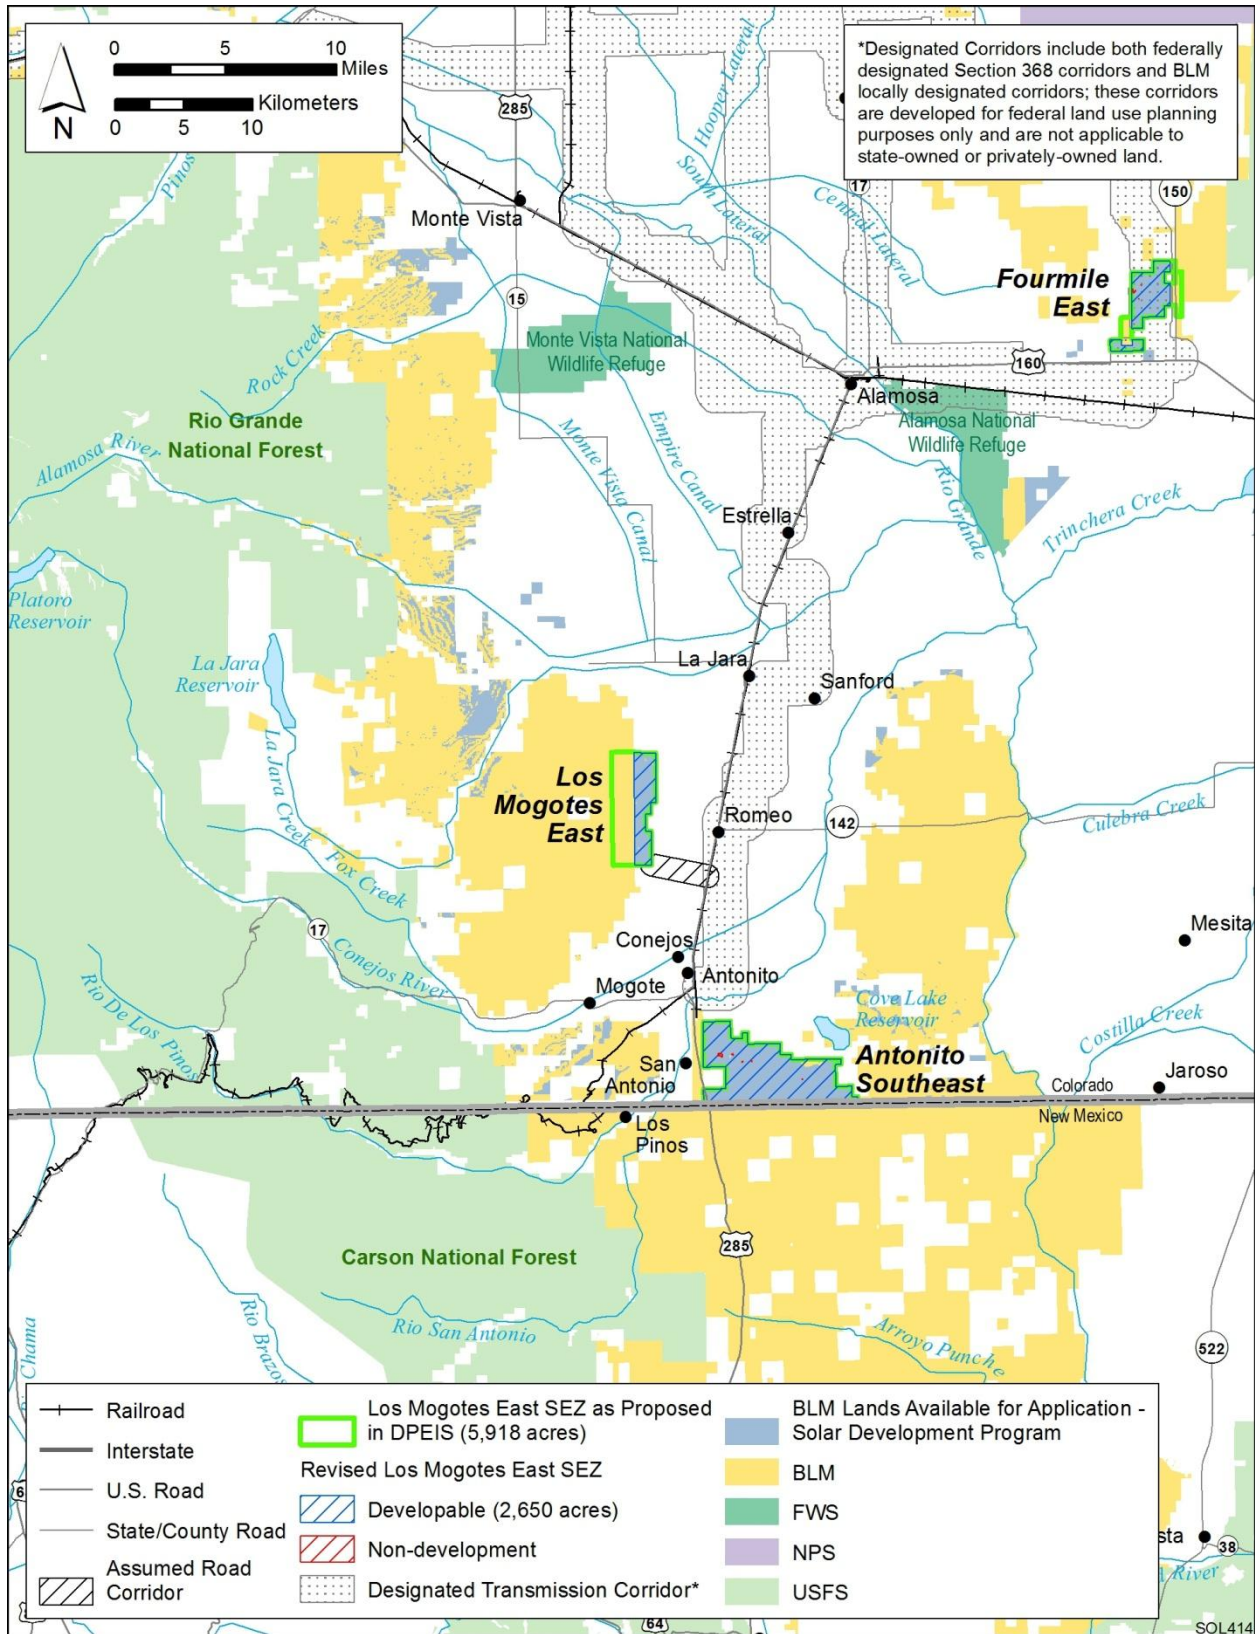

18
19 As published in the Draft Solar PEIS (BLM and DOE 2010), the proposed Los Mogotes
20 East SEZ had a total area of 5,918 acres (24 km²) (see Figure 10.4.1.1-1). In the Supplement to
21 the Draft Solar PEIS (BLM and DOE 2011), the SEZ boundaries were revised, eliminating
22 more than half of the area, that is, 3,268 acres (13.2 km²) on the western side of the SEZ (see
23 Figure 10.4.1.1-2). Excluding this area will avoid or minimize impacts on significant cultural
24 resources; grazing allotments; an important riparian area; Gunnison prairie dog, burrowing owl,
25 ferruginous hawk, mountain plover, pronghorn birthing and winter habitat; and visual resources.
26 The remaining SEZ area is 2,650 acres (10.7 km²). No additional areas for non-development
27 were identified within the SEZ.

28
29 Because of the extensive potential impacts from solar development in the portion of the
30 Los Mogotes East SEZ that has been eliminated, those lands are proposed as solar ROW
31 exclusion areas; that is, applications for solar development on those lands will not be accepted by
32 the BLM.

33
34 The analyses in the following sections update the affected environment and potential
35 environmental, cultural, and socioeconomic impacts associated with utility-scale solar energy
36 development in the proposed Los Mogotes East SEZ as described in the Draft Solar PEIS.

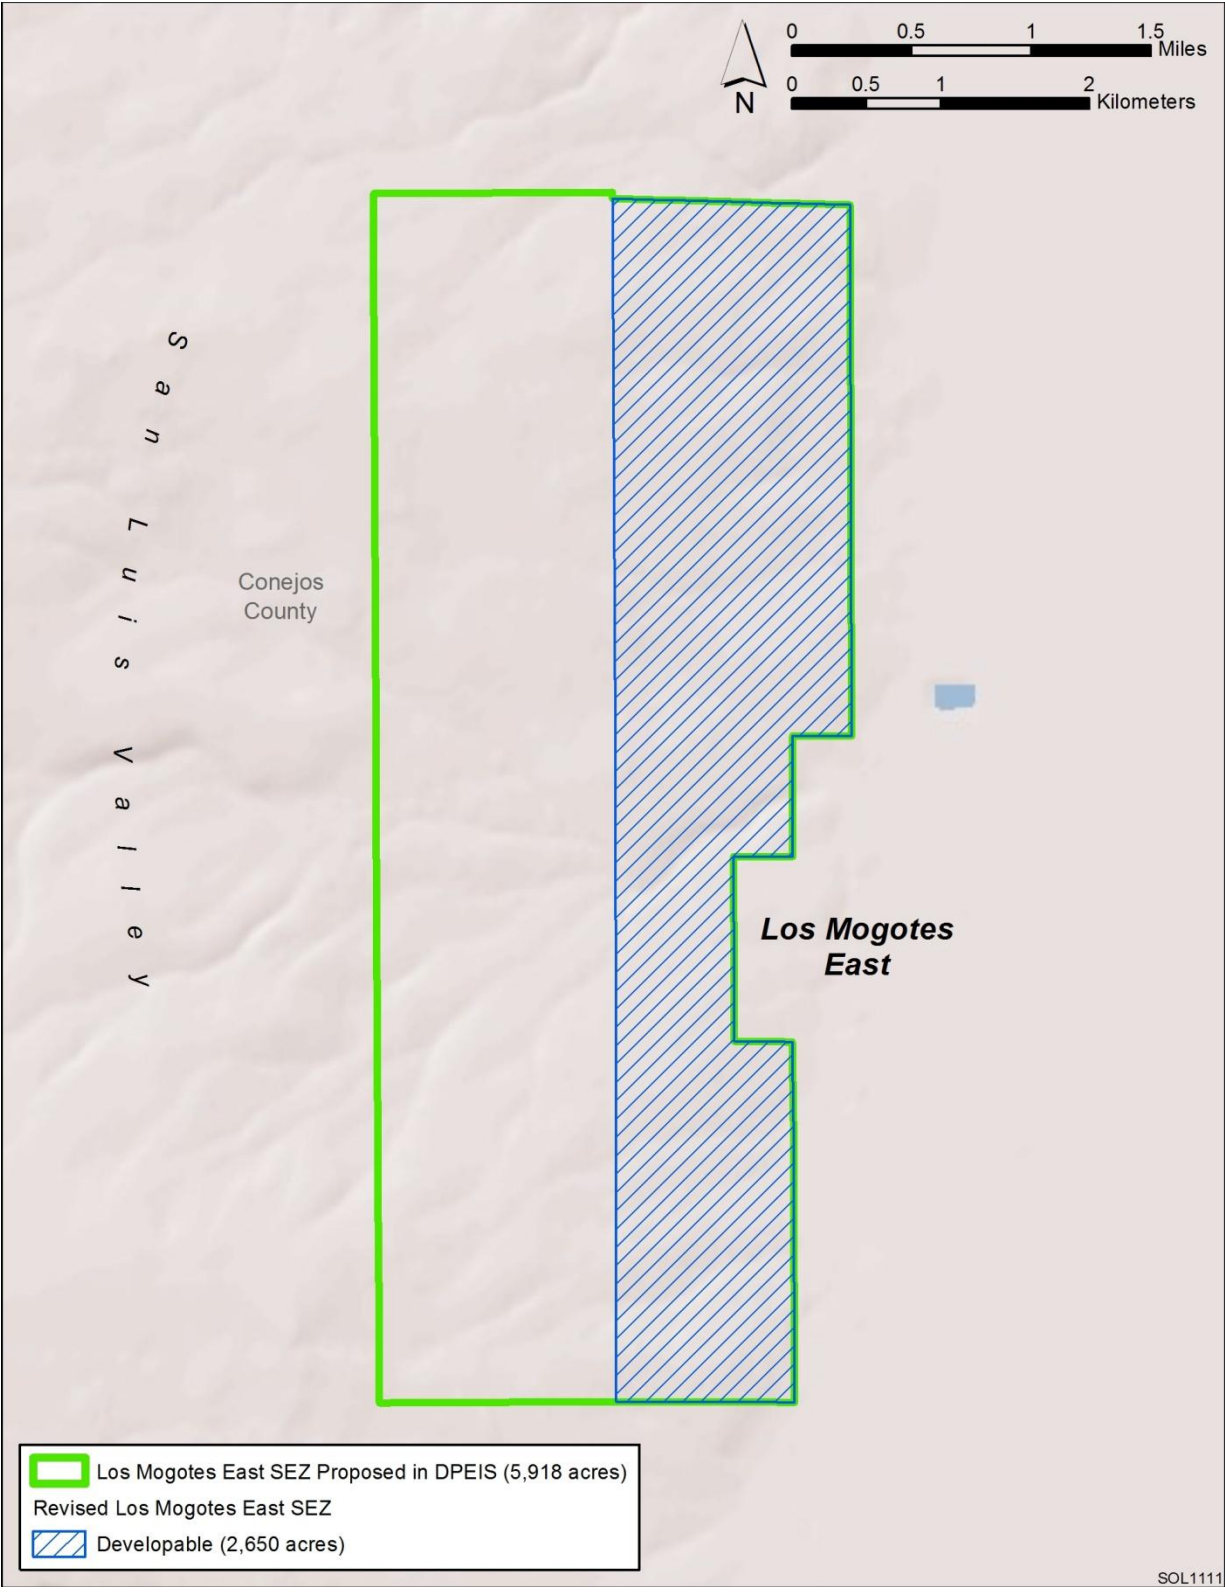

37
38
39 **10.4.1.2 Development Assumptions for the Impact Analysis**

40
41 Maximum development of the proposed Los Mogotes East SEZ is assumed to be
42 80% of the total SEZ area over a period of 20 years, a maximum of 2,120 acres (8.58 km²)
43 (Table 10.4.1.2-1). Full development of the Los Mogotes East SEZ would allow development
44 of facilities with an estimated total of between 236 MW (dish engine or PV technologies,
45 9 acres/MW [0.04 km²/MW]) and 424 MW (solar trough technologies, 5 acres/MW
46 [0.02 km²/MW]) of electrical power capacity.

1

2 **FIGURE 10.4.1.1-1 Proposed Los Mogotes East SEZ as Revised**

1

2
3

FIGURE 10.4.1.1-2 Developable and Non-development Areas for the Proposed Los Mogotes East SEZ as Revised

1 **TABLE 10.4.1.2-1 Assumed Development Acreages, Solar MW Output, and Nearest Major**
 2 **Access Road and Transmission Line for the Proposed Los Mogotes East SEZ as Revised**

Total Developable Acreage and Assumed Development Acreage (80% of Total)	Assumed Maximum SEZ Output for Various Solar Technologies	Distance to Nearest State, U.S., or Interstate Highway	Distance and Capacity of Nearest Existing Transmission Line	Assumed Area of Road ROW	Distance to Nearest BLM Designated Corridor ^e
2,650 acres ^a and 2,120 acres	236 MW ^b 424 MW ^c	3 mi ^d (U.S. 285)	Adjacent and 69 kV	22 acres	NA ^f

- a To convert acres to km², multiply by 0.004047.
- b Maximum power output if the SEZ was fully developed using power tower, dish engine, or PV technologies, assuming 9 acres/MW (0.04 km²/MW) of land required.
- c Maximum power output if the SEZ were fully developed using solar trough technologies, assuming 5 acres/MW (0.02 km²/MW) of land required.
- d To convert mi to km, multiply by 1.609.
- e BLM-designated corridors are developed for federal land use planning purposes only and are not applicable to state-owned or privately owned land.
- f NA = no BLM-designated corridor is near the proposed Los Mogotes East SEZ.

3
 4
 5 Availability of transmission from SEZs to load centers will be an important consideration
 6 for future development in SEZs. For the proposed Los Mogotes East SEZ, updated data indicate
 7 that the nearest existing transmission line is a 69-kV line located about 3 mi (5 km) to the east of
 8 the SEZ (the Draft Solar PEIS had indicated that there was a 69-kV transmission line adjacent to
 9 the proposed SEZ). It is possible that this existing line could be used to provide access from the
 10 SEZ to the transmission grid, but the 69-kV capacity of the existing line would not be adequate
 11 for 236 to 424 MW of new capacity. Therefore, at full build-out capacity, new transmission lines
 12 and possibly upgrades of existing transmission lines would be required to bring electricity from
 13 the proposed Los Mogotes East SEZ to load centers. An assessment of the most likely load
 14 center destinations for power generated at the Los Mogotes East SEZ and a general assessment
 15 of the impacts of constructing and operating new transmission facilities to those load centers is
 16 provided in Section 10.4.23. In addition, the generic impacts of transmission and associated
 17 infrastructure construction and of line upgrades for various resources are discussed in Chapter 5
 18 of this Final Solar PEIS. Project-specific analyses would also be required to identify the specific
 19 impacts of new transmission construction and line upgrades for any projects proposed within
 20 the SEZ.

21
 22 For the proposed Los Mogotes East SEZ, U.S. 285 runs north–south about 3 mi (5 km)
 23 to the east of the SEZ. Assuming construction of a new access road to reach U.S. 285 would
 24 be needed to support construction and operation of solar facilities, approximately 22 acres
 25 (0.09 km²) of land disturbance would occur (a 60-ft [18.3-m] wide ROW was assumed), as
 26 summarized in Table 10.4.1.2-1.

1 **10.4.1.3 Programmatic and SEZ-Specific Design Features**
2

3 The proposed programmatic design features for each resource area to be required under
4 the BLM Solar Energy Program are presented in Section A.2.2 of Appendix A of this Final Solar
5 PEIS. These programmatic design features are intended to avoid, minimize, and/or mitigate
6 adverse impacts from solar energy development and will be required for development on all
7 BLM-administered lands, including SEZ and non-SEZ lands.
8

9 The discussions below addressing potential impacts of solar energy development on
10 specific resource areas (Sections 10.4.2 through 10.4.22) also provide an assessment of the
11 effectiveness of the programmatic design features in mitigating adverse impacts from solar
12 development within the SEZ. SEZ-specific design features to address impacts specific to the
13 proposed Los Mogotes East SEZ may be required in addition to the programmatic design
14 features. The proposed SEZ-specific design features for the Los Mogotes East SEZ have been
15 updated on the basis of revisions to the SEZ since the Draft Solar PEIS (such as boundary
16 changes and the identification of non-development areas) and on the basis of comments received
17 on the Draft Solar PEIS and the Supplement to the Draft. All applicable SEZ-specific design
18 features identified to date (including those from the Draft Solar PEIS that are still applicable) are
19 presented in Sections 10.4.2 through 10.4.22.
20
21

22 **10.4.2 Lands and Realty**
23

24 **10.4.2.1 Affected Environment**
25
26

27 The proposed Los Mogotes East SEZ has been reduced in size to 2,650 acres (10.7 km²)
28 by moving the western boundary of the SEZ to the east. Three county roads provide access to the
29 SEZ, and two roads cross the area and provide access to a well-blocked area of public land west
30 of the proposed SEZ. Two sections of state-owned land abut the SEZ, one on the north and one
31 on the south.
32

33 **10.4.2.2 Impacts**
34
35

36 Solar development in the proposed SEZ would establish a large industrial area that would
37 exclude many existing and potential uses of the land, perhaps in perpetuity. Because the SEZ is
38 undeveloped and rural, utility-scale solar energy development would introduce a new and
39 discordant land use in the area. Access routes to lands west of the SEZ could be affected by solar
40 energy development if legal access through the SEZ is not maintained. If the public lands are
41 developed for solar energy production, similar development could be induced on neighboring
42 state and private lands with landowner agreement.
43
44

1 **10.4.2.3 SEZ-Specific Design Features and Design Feature Effectiveness**
2

3 Required programmatic design features that would reduce impacts on lands and realty
4 activities are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing
5 the programmatic design features will provide some mitigation for identified impacts but will not
6 mitigate all adverse impacts. For example, impacts related to the exclusion of many existing and
7 potential uses of the public land; the visual impact of an industrial-type solar facility within an
8 otherwise rural area; and induced land use changes, if any, on nearby or adjacent state and
9 private lands may not be fully mitigated.

10
11 No SEZ-specific design features for lands and realty have been identified through this
12 Final Solar PEIS. Some SEZ-specific design features may be established for parcels within the
13 Los Mogotes East SEZ through the process of preparing parcels for competitive offer and
14 subsequent project-specific analysis.

15
16
17 **10.4.3 Specially Designated Areas and Lands with Wilderness Characteristics**
18

19
20 **10.4.3.1 Affected Environment**
21

22 There are six categories of specially designated areas within 25 mi (40 km) of the
23 proposed Los Mogotes East SEZ. The affected environment section of the Draft Solar PEIS
24 accurately describes these areas with one addition. A recently maintained inventory of
25 wilderness characteristics determined that public lands within the proposed SEZ do not contain
26 wilderness characteristics.

27
28
29 **10.4.3.2 Impacts**
30

31 Solar energy development of the SEZ will still result in the development of a very large
32 industrial site in an area that otherwise is currently rural and undeveloped. The level of visual
33 impacts on specially designated areas would be affected by the types of solar technologies
34 deployed within the SEZ. Shorter facilities, facilities with less reflectivity, and facilities that do
35 not use wet cooling would be expected to have less potential for adverse visual impact on these
36 areas.

37
38 Elevated viewpoints such as the slightly elevated portions of the CTSR or nearby
39 viewpoints such as the West Fork of the North Branch of the Old Spanish Trail or the
40 Los Caminos Antiguos Scenic Byway would have significant views of development within the
41 SEZ and would likely be adversely affected. Site-specific analysis, including consideration of the
42 potential for visible glint and glare from solar panels, and the visibility of structures, will need to
43 be completed before impacts can be fully assessed and potential mitigation measures considered.
44 Travelers coming north or west on the Los Caminos Antiguos Scenic Byway would be looking
45 directly into the SEZ, and development within the SEZ would be very visible, having the
46 potential to detract from the visitor experience. The route of a portion of the West Fork of the

1 North Branch of the Old Spanish Trail parallels and passes within 1.0 mi (1.6 km) of the SEZ.
2 Solar development in the SEZ may have a major impact on the historic and visual integrity of the
3 Trail, depending on the determination of the integrity and historical significance of the portion of
4 the Trail from which solar development could be seen. Development within the SEZ also may be
5 inconsistent with the purposes for which the Sangre de Cristo NHA was designated.
6

7 The Los Mogotes ACEC, which is located 2 mi (3.2 km) west of the ACEC, is designated
8 for protection of wildlife resources. Development of solar energy facilities in the SEZ has the
9 potential to introduce additional vehicular and human presence in or near the ACEC that could
10 impair its overall value to wildlife.
11

12 **10.4.3.3 SEZ-Specific Design Features and Design Feature Effectiveness**

13
14
15 Required programmatic design features that would reduce impacts on specially
16 designated areas are described in Section A.2.2 of Appendix A of this Final Solar PEIS (design
17 features for specially designated areas, cultural resources, and visual resources would address
18 impacts). Implementing the programmatic design features will provide some mitigation for the
19 identified impacts but would not eliminate potential impacts on the Los Caminos Antiguos
20 Scenic Byway. Impacts on the Sangre de Cristo National Heritage Area also may not be
21 mitigated by the programmatic design features. Programmatic design features will be applied
22 to address SEZ-specific resources and conditions, for example:
23

- 24 • For projects in the Los Mogotes SEZ that are located within the viewshed of
25 the West Fork of the North Branch of the Old Spanish Trail, a National Trail
26 inventory will be required to determine the area of possible adverse impact
27 on resources, qualities, values, and associated settings of the Trail; to
28 prevent substantial interference; and to determine any areas unsuitable for
29 development. Residual impacts will be avoided, minimized, and/or mitigated
30 to the extent practicable according to program policy standards. Programmatic
31 design features have been included in BLM's Solar Energy Program to
32 address impacts on National Historic Trails (see Section A.2.2.23 of
33 Appendix A).
34

35 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
36 analyses due to changes to the SEZ boundaries, and consideration of comments received as
37 applicable, the following SEZ-specific design feature has been identified:
38

- 39 • Early consultation should be initiated with the entity responsible for
40 developing the management plan for the Sangre de Cristo NHA to understand
41 how development of the SEZ could be consistent with NHA plans and goals.
42

43 The need for additional SEZ-specific design features will be identified through the
44 process of preparing parcels for competitive offer and subsequent project-specific analysis.
45
46

1 **10.4.4 Rangeland Resources**

2
3
4 **10.4.4.1 Livestock Grazing**

5
6
7 ***10.4.4.1.1 Affected Environment***

8
9 Although the proposed SEZ has been reduced in size, it still includes portions of three
10 seasonal grazing allotments: Ciscom Flat (#14212), Capulin (#14207), and Little Mogotes
11 (#24222). The allotments are used by four permittees and support a total forage production of
12 2,337 AUMs per year. There are livestock management facilities, including fences and watering
13 places in the SEZ. Table 10.4.4.1-1 summarizes key acreage and production data for these
14 allotments.

15
16
17 ***10.4.4.1.2 Impacts***

18
19 Should utility-scale solar development occur within the SEZ, grazing would be excluded
20 from the areas developed, as provided for in the BLM grazing regulations (43 CFR Part 4100).
21 The reduction in the size of the proposed SEZ has reduced the potential impact on all three
22 allotments, especially on the Ciscom Flat allotment. Even with the reduction in the size of the
23 SEZ, there still would be a major impact on the Ciscom Flat allotment that may have serious
24 long-term consequences for this operation. The impact on the other two allotments would be
25 substantially less, but the actual significance of their losses is undetermined at this time. While
26 the specific situation of each of the grazing permittees is not known, loss of a portion of their
27 grazing permit would be an adverse impact on them. Economic losses would not be limited to
28 the value of the lost grazing opportunity but would extend also to the value of the overall ranch
29 operations including any private lands tied to the grazing operations. While permittees would be
30 reimbursed for their portion of the value of range improvements on their permits, this would not
31 cover their economic loss. By using the simplified methodology utilized in the Draft Solar PEIS,
32 the estimated losses by allotment are shown in Table 10.4.4.1-1 Actual losses would be
33 determined based on the amount of actual forage lost on the lands excluded from the grazing
34 permits, not on the percentage of the allotment that is lost.

35
36
37 ***10.4.4.1.3 SEZ-Specific Design Features and Design Feature Effectiveness***

38
39 Required programmatic design features that would reduce impacts on livestock grazing
40 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the
41 programmatic design features will provide some mitigation for identified impacts, but they
42 would not mitigate the loss of livestock AUMs or the loss of value in ranching operations
43 including private land values.

1
2

TABLE 10.4.4.1-1 Grazing Allotments within the Proposed Los Mogotes East SEZ as Revised

Allotment	Total Acres ^a	Percentage Total in SEZ ^b	Active BLM AUMs	Estimated Loss of AUMs	No. of Permittees
Ciscom Flat	4,320	38	191	73	1
Capulin	8,790	3.4	742	25	1
Little Mogotes	13,803	6.4	1,404	90	2

^a Total acreage, including public and state land, and AUMs, is from the BLM Rangeland Administration System report (BLM 2008). To convert acres to km², multiply by 0.004047.

^b Represents the percentage of public land in the allotment, within the SEZ.

3
4
5
6
7
8
9

No SEZ-specific design features to protect livestock grazing have been identified in this Final Solar PEIS. Some SEZ-specific design features may be identified through the process of preparing parcels for competitive offer and subsequent project-specific analysis.

10 **10.4.4.2 Wild Horses and Burros**

11
12
13
14

10.4.4.2.1 Affected Environment

15 As presented in the Draft Solar PEIS, no wild horse or burro HMAs occur within the
16 proposed Los Mogotes East SEZ or in proximity to it. The reduction of the SEZ to less than half
17 its original size does not alter these data.

18
19

20 ***10.4.4.2.2 Impacts***

21
22
23
24

As presented in the Draft Solar PEIS, solar energy development within the proposed Los Mogotes East SEZ would not affect wild horses and burros. The reduction in size of the SEZ does not affect this conclusion.

25
26

27 ***10.4.4.2.3 SEZ-Specific Design Features and Design Feature Effectiveness***

28
29
30
31

Because solar energy development within the proposed Los Mogotes East SEZ would not affect wild horses and burros, no SEZ-specific design features to address wild horses and burros have been identified in this Final Solar PEIS.

32
33

1 **10.4.5 Recreation**

2
3
4 **10.4.5.1 Affected Environment**

5
6 The area of the proposed Los Mogotes East SEZ has been reduced by about 55%, to
7 2,650 acres (10.7 km²) by moving the western boundary of the SEZ to the east.
8

9 Commentors have pointed out that most of the recreation discussion in the Draft Solar
10 PEIS focused internally within the SEZ and did not address the larger part that public and other
11 federal lands play in the landscape and tourism economy of the San Luis Valley. A summary of
12 the better known attractions within the valley includes Great Sand Dunes National Park and
13 Preserve, the Old Spanish Trail, two scenic railroads, the Los Caminos Antiguos Scenic Byway,
14 the Sangre de Cristo Mountains, three national wildlife refuges, and numerous designated
15 wilderness areas; these are among the highlights of the recreational and tourism opportunities in
16 the area. The Los Mogotes East SEZ is adjacent to U.S. 285, which is the major access route into
17 the Valley from the south and which is a part of the Los Caminos Antiguos Scenic Byway.
18 Tourism is an important part of the Valley economy and is an important focus for future
19 economic growth.
20

21 While the public land within the proposed Los Mogotes East SEZ is flat and generally
22 unremarkable, it is also large and conspicuous because it is undeveloped and is readily accessible
23 to recreational users. It also adjoins a large block of public lands to the west. As described in the
24 Draft Solar PEIS, the area supports a range of dispersed recreation activities, although it is
25 believed that levels of recreational use are low. The CDOW has commented the area is important
26 habitat for pronghorn antelope, an important species for hunting in the area. More detailed
27 information on impacts on these species can be found in Section 10.4.11.3.2 of the Draft Solar
28 PEIS.
29
30

31 **10.4.5.2 Impacts**

32
33 Solar development of the proposed Los Mogotes East SEZ still will be readily visible
34 to travelers on U.S. 285 and on the Los Caminos Antiguos Scenic Byway. Since the proposed
35 SEZ is large, solar development of the area has the potential to influence the impressions of
36 recreational and tourism visitors entering the San Luis Valley via routes near the SEZ. Whether
37 there would be a potential impact on recreation and tourism in the valley because of the solar
38 development along these access routes is unknown. There may be potential to provide
39 interpretive activities focused on solar energy and development that would be of interest to
40 travelers.
41

42 Because the route of the Old Spanish Trail is so near the SEZ, it is anticipated that the
43 viewshed of the Trail would be adversely affected by solar development within the SEZ and
44 may reduce the potential future recreational attraction of the Trail. However, the integrity and
45 historical significance of the portion of the Trail near to the proposed SEZ remain undetermined.
46

1 Visual impacts on surrounding recreational use areas would be greater with taller solar
2 facilities such as power towers and facilities with wet cooling. Visitors to areas located at higher
3 elevations than the SEZ (e.g., San Luis Hills ACEC and WSA, CTSR) will see the solar
4 development within the SEZ, but the impact on recreational use of these areas is unknown at this
5 time. The types of solar technologies employed and whether there is significant glint or glare
6 from reflective surfaces of solar facilities would play a large role in the extent of visibility of
7 solar development. The focus and intent of the relatively new Sangre de Cristo NHA is not yet
8 well defined, so it has not been possible to assess how solar development may interact with the
9 objectives of the NHA.

10
11 The CDOW has commented there is a specific concern about the loss of pronghorn
12 antelope habitat in Game Management Unit (GMU) 81, where the SEZ is located. There are
13 limited antelope hunting permits issued in the GMU, and reductions in habitat that would occur
14 due to solar development within the SEZ could result in a reduction in antelope hunting
15 opportunities. However, the overall impact on pronghorn was estimated to be small in this
16 assessment (see Section 10.4.11.4.2 of the Draft Solar PEIS), because only a small portion of the
17 available habitat in the valley occurs within the proposed SEZ.

18
19 In addition, lands that are outside of the proposed SEZ may be acquired or managed for
20 mitigation of impacts on other resources (e.g., sensitive species). Managing these lands for
21 mitigation could further exclude or restrict recreational use, potentially, leading to additional
22 losses in recreational opportunities in the region. The impact of acquisition and management of
23 mitigation lands would be considered as a part of the environmental analysis of specific solar
24 energy projects.

25 26 27 **10.4.5.3 SEZ-Specific Design Features and Design Feature Effectiveness**

28
29 Required programmatic design features that would reduce impacts on recreational
30 resources are described in Section A.2.2 of Appendix A of this Final Solar PEIS (design features
31 for both specially designated areas and visual resources also would address some impacts). Some
32 additional SEZ-specific design features may be established when specific projects are being
33 considered within the SEZ. Implementing the programmatic design features will provide some
34 mitigation for the identified impacts but will not mitigate the loss of recreational access to public
35 lands developed for solar energy production. Likewise, a loss of wildlife-related hunting
36 recreation would not be mitigated.

37
38 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
39 analyses, and consideration of comments received as applicable, the following SEZ-specific
40 design feature has been identified:

- 41
42 • Tourism is an important economic growth area for the San Luis Valley, and
43 the proposed Los Mogotes East SEZ is located in a visible location adjacent to
44 a principal highway route into the Valley. Because of the location of the SEZ,
45 there is potential to influence visitors' perception of the tourism climate in the

1 Valley. As projects are proposed for the SEZ, the potential impacts on tourism
2 should be considered and reviewed with local community leaders.
3

4 The need for additional SEZ-specific design features will be identified through the
5 process of preparing parcels for competitive offer and subsequent project-specific analysis.
6
7

8 **10.4.6 Military and Civilian Aviation**

9

10 **10.4.6.1 Affected Environment**

11

12
13 There are no identified military or civilian aviation uses in close proximity to the
14 proposed Los Mogotes East SEZ.
15

16 **10.4.6.2 Impacts**

17

18
19 There are no identified impacts on military or civilian aviation facilities associated with
20 the proposed Los Mogotes East SEZ.
21

22 **10.4.6.3 SEZ-Specific Design Features and Design Feature Effectiveness**

23

24
25 Required programmatic design features that would reduce impacts on military and
26 civilian aviation are described in Section A.2.2 of Appendix A of this Final Solar PEIS. The
27 programmatic design features require early coordination with the DoD to identify and mitigate,
28 if possible, any potential impacts on the use of military airspace.
29

30 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
31 comments received as applicable, no SEZ-specific design features to protect military or civilian
32 airspace for the proposed Los Mogotes East SEZ have been identified. Some SEZ-specific
33 design features may be identified through the process of preparing parcels for competitive offer
34 and subsequent project-specific analysis.
35

36 **10.4.7 Geologic Setting and Soil Resources**

37

38 **10.4.7.1 Affected Environment**

39

40 ***10.4.7.1.1 Geologic Setting***

41
42

43
44
45 Data provided in the Draft Solar PEIS remain valid, with the following update:
46

- 1 • The terrain of the proposed Los Mogotes East SEZ is relatively flat with a
2 gentle dip to the east (Figure 10.4.7.1-1). The boundaries of the SEZ have
3 been changed to eliminate more than half of the area, 3,268 acres (13.2 km²),
4 on the western side of the site. Based on these changes, the elevations range
5 from about 7,850 ft (2,393 m) along the new western site boundary to about
6 7,710 ft (2,350 m) along its eastern boundary.
7
8

9 **10.4.7.1.2 Soil Resources**

10 Data provided in the Draft Solar PEIS remain valid, with the following updates:
11
12

- 13 • Soils within the proposed Los Mogotes East SEZ as revised are predominantly
14 the very stony and cobbly loams of the Travelers and Garita Series, which
15 now make up about 95% of the soil coverage at the site.
16
17 • Soil unit coverage at the proposed Los Mogotes East SEZ as revised is shown
18 in Figure 10.4.7.1-2. The new SEZ boundaries eliminate 2,333 acres (9.4 km²)
19 of the Travelers very stony loam (1 to 3% slopes), 465 acres (1.9 km²) of the
20 Garita cobbly loam (3 to 25% slopes), 454 acres (1.8 km²; all) of the
21 Travelers very stony loam (3 to 25%), and 4 acres (0.016 km²) of the Monte
22 loam (0 to 1% slopes) (Table 10.4.7.1-1).
23
24

25 **10.4.7.2 Impacts**

26
27 Impacts on soil resources would occur mainly as a result of ground-disturbing activities
28 (e.g., grading, excavating, and drilling), especially during the construction phase of a solar
29 project. The assessment provided in the Draft Solar PEIS remains valid, with the following
30 update:
31

- 32 • Impacts related to wind erodibility are reduced because the new SEZ
33 boundaries eliminate 469 acres (1.9 km²) of moderately erodible soils from
34 development.
35
36

37 **10.4.7.3 SEZ-Specific Design Features and Design Feature Effectiveness**

38
39 Required programmatic design features that would reduce impacts on soils are described
40 in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the programmatic design
41 features will reduce the potential for soil impacts during all project phases.
42

43 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
44 analyses due to changes to the SEZ boundaries, and considering comments received as
45 applicable, no SEZ-specific design features were identified for soil resources at the proposed
46

2 **FIGURE 10.4.7.1-2 Soil Map for the Proposed Los Mogotes East SEZ as Revised (NRCS 2008)**

1 **TABLE 10.4.7.1-1 Summary of Soil Map Units within the Proposed Los Mogotes East SEZ as Revised**

Map Unit Symbol	Map Unit Name	Erosion Potential		Description	Area in Acres ^c (percentage of SEZ)
		Water ^a	Wind ^b		
53	Travelers very stony loam (1 to 3%)	Slight	Low (WEG 8) ^d	Nearly level soils on mesas and hillslopes capped by basalts, andesite, and/or rhyolite. Parent material consists of thin calcareous sediments weathered from basalt. Shallow and well to somewhat excessively drained, with high surface-runoff potential (low infiltration rate) and moderate to moderately rapid permeability. Available water capacity is very low. Used mainly as rangeland. Susceptible to compaction.	1,916 (72.3)
18	Garita cobbly loam (3 to 25%)	Slight	Moderate (WEG 4)	Nearly level to gently sloping soils on alluvial fans and fan terraces. Parent material consists of thick calcareous and gravelly alluvium derived from basalt. Deep and well drained, with moderate surface-runoff potential and moderate permeability. Available water capacity is low. Used mainly as native pastureland. Susceptible to compaction.	610 (23.01)
53	Travelers very stony loam (3 to 25%)	Slight	Low (WEG 8)	Nearly level to gently sloping soils on mesas and hill slopes capped by basalts, andesite, and/or rhyolite. Parent material consists of thin calcareous material weathered from basalt. Shallow and well to somewhat excessively drained, with high surface-runoff potential (low infiltration rate) and moderate to moderately rapid permeability. Available water capacity is very low. Used mainly as rangeland. Susceptible to compaction.	454 (8)
28	Luhon loam (1 to 3%)	Slight	Moderate (WEG 4)	Nearly level soils on alluvial fans and valley side slopes. Parent material consists of mixed calcareous alluvium. Deep and well drained with moderate surface-runoff potential and moderate permeability. Available water capacity is high. Used mainly as native pastureland; prime farmland if irrigated. ^e Susceptible to compaction; severe rutting hazard.	90 (3.4)

TABLE 10.4.7.1-1 (Cont.)

Map Unit Symbol	Map Unit Name	Erosion Potential		Description	Area in Acres ^c (percentage of SEZ)
		Water ^a	Wind ^b		
19	Graypoint gravelly sandy loam (0 to 1%)	Slight	Moderate (WEG 4)	Nearly level soils on broad fans and fan terraces. Formed in alluvium derived from basalt. Deep and somewhat poorly drained, with moderate surface-runoff potential and moderate permeability. Shrink-swell potential is low to moderate. Available water capacity is low. Used mainly as rangeland and irrigated cropland, pasture, and hay land. Susceptible to compaction.	32 (1.2)
37, 38	Monte loam (0 to 3%)	Slight	Moderate (WEG 4)	Nearly level soils on alluvial fans and floodplains. Parent material consists of alluvium derived from rhyolite and latite. Soils are deep and well drained, with moderate surface-runoff potential and moderate permeability. Available water capacity is high. Used mainly for native rangeland and irrigated cropland; prime farmland if irrigated. Susceptible to compaction; severe rutting hazard.	3 (<1)

^a Water erosion potential rates the hazard of soil loss from off-road and off-trail areas after disturbance activities that expose the soil surface. The ratings are based on slope and soil erosion factor K and represent soil loss caused by sheet or rill erosion where 50 to 75% of the surface has been exposed by ground disturbance. A rating of “slight” indicates that erosion is unlikely under ordinary climatic conditions.

^b Wind erosion potential here is based on the wind erodibility group (WEG) designation: groups 1 and 2, high; groups 3 through 6, moderate; and groups 7 and 8, low (see footnote d for further explanation).

^c To convert acres to km², multiply by 0.004047.

^d WEGs are based on soil texture, content of organic matter, effervescence of carbonates, content of rock fragments, and mineralogy, and also take into account soil moisture, surface cover, soil surface roughness, wind velocity and direction, and the length of unsheltered distance (USDA 2004). Groups range in value from 1 (most susceptible to wind erosion) to 8 (least susceptible to wind erosion). The NRCS provides a wind erodibility index, expressed as an erosion rate in tons per acre (4,000 m²) per year, for each of the wind erodibility groups: WEG 1, 220 tons (200 metric tons) per acre (4,000 m²) per year (average); WEG 2, 134 tons (122 metric tons) per acre (4,000 m²) per year; WEGs 3 and 4 (and 4L), 86 tons (78 metric tons) per acre (4,000 m²) per year; WEG 5, 56 tons (51 metric tons) per acre (4,000 m²) per year; WEG 6, 48 tons (44 metric tons) per acre (4,000 m²) per year; WEG 7, 38 tons (34 metric tons) per acre (4,000 m²) per year; and WEG 8, 0 tons (0 metric tons) per acre (4,000 m²) per year.

^e Prime farmland is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and that is available for these uses.

1 Los Mogotes East SEZ. Some SEZ-specific design features may be identified through the
2 process of preparing parcels for competitive offer and subsequent project-specific analysis.
3
4

5 **10.4.8 Minerals (Fluids, Solids, and Geothermal Resources)** 6

7 A mineral potential assessment for the proposed Los Mogotes East SEZ has been
8 prepared and reviewed by BLM mineral specialists knowledgeable about the region where the
9 SEZ is located (BLM 2012). The BLM is proposing to withdraw the SEZ from settlement, sale,
10 location, or entry under the general land laws, including the mining laws, for a period of 20 years
11 (see Section 2.2.2.2.4 of the Final Solar PEIS). The potential impacts of this withdrawal are
12 discussed in Section 10.4.24.
13
14

15 **10.4.8.1 Affected Environment** 16

17 There are no oil and gas leases, mining claims, or geothermal leases located in the
18 proposed SEZ. The description in the Draft Solar PEIS remains valid.
19
20

21 **10.4.8.2 Impacts** 22

23 There are no anticipated impacts on mineral resources from the development of solar
24 energy facilities in the proposed SEZ. The analysis of impacts on mineral resources in the Draft
25 Solar PEIS remains valid.
26
27

28 **10.4.8.3 SEZ-Specific Design Features and Design Feature Effectiveness** 29

30 Required programmatic design features that will reduce impacts on mineral resources are
31 described in Appendix A of this Final Solar PEIS. Implementing the programmatic design
32 features will provide adequate protection of mineral resources.
33

34 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
35 analyses due to changes to the SEZ boundaries, and consideration of comments received as
36 applicable, no SEZ-specific design features for minerals have been identified in this Final Solar
37 PEIS. Some SEZ-specific design features may be identified through the process of preparing
38 parcels for competitive offer and subsequent project-specific analysis.
39
40

41 **10.4.9 Water Resources** 42 43

44 **10.4.9.1 Affected Environment** 45

46 The overall size of the Los Mogotes East SEZ has been reduced by 55% from the area
47 described in the Draft Solar PEIS, resulting in a total area of 2,650 acres (10.7 km²). The

1 description of the affected environment given in the Draft Solar PEIS relevant to water resources
2 at the Los Mogotes East SEZ remains valid and is summarized in the following paragraphs.
3

4 The Los Mogotes East SEZ is within the Rio Grande Headwaters subbasin of the
5 Rio Grande hydrologic region. The SEZ is located in the southern portion of the San Luis Valley
6 bounded by the San Juan Mountains to the west and the Sangre de Cristo Mountains to the east.
7 Precipitation and snowfall in the southern part of the valley is about 7 in./yr (18 cm/yr) and
8 25 in./yr (64 cm/yr), respectively, with much greater amounts in the surrounding mountains.
9 Pan evaporation rates are estimated to be on the order of 54 in./yr (137 cm/yr). No permanent
10 surface water features or wetlands have been identified within the SEZ. There are several
11 intermittent/ephemeral washes within the SEZ that drain across the site from the west to
12 east. Flood hazards have not been identified, but intermittent flooding may occur along the
13 intermittent/ephemeral washes. Groundwater in the San Luis Valley is primarily in basin-fill
14 deposits with an upper unconfined aquifer and a lower confined aquifer, which are separated by a
15 series of confining clay layers and unfractured volcanic rocks. There are no confining clay layers
16 in the vicinity of the Los Mogotes East SEZ; however, a basalt layer that is near the surface acts
17 as a confining unit over the basin-fill aquifer. Groundwater monitoring wells near the SEZ have
18 reported depths to groundwater ranging from 15 to 35 ft (5 to 11 m) and indicate a groundwater
19 flow from west to east. Water quality in the aquifers of the San Luis Valley varies, but total
20 dissolved solids concentrations in the southern portion of the valley are generally below
21 maximum contaminant levels.
22

23 The Los Mogotes East SEZ is located in the Colorado Division 3 management zone
24 (Rio Grande Basin) of the Colorado DWR, where both surface water and groundwater rights are
25 overappropriated. The Rio Grande Compact of 1938 obligates Colorado to meet water delivery
26 schedules to New Mexico and governs much of the water management decision making in the
27 San Luis Valley. In order to balance water uses within the San Luis Valley and to meet treaty
28 obligations, several water management mechanisms have been developed that affect existing
29 water rights and water rights transfers. The two primary water management considerations
30 affecting solar energy development are the need for an augmentation water plan and the rules set
31 by the recently formed Special Improvement District Number 1 (Subdistrict #1). Augmentation
32 water plans were described in the Draft Solar PEIS (Section 10.4.9.1.3), but they essentially
33 require junior water rights holders to have additional water reserves to ensure that more senior
34 water rights are not hindered. The water management plan for Subdistrict #1 was ruled on in
35 June 2010 and places restrictions on groundwater withdrawals in an effort to restore groundwater
36 levels in the unconfined aquifer. None of the Colorado SEZs are located within the boundaries of
37 Subdistrict #1, which primarily includes central portions of the San Luis Valley currently used
38 for agriculture. However, because water rights are overappropriated in the San Luis Valley and
39 largely clustered within Subdistrict #1, it is likely that any new water diversions and water rights
40 transfers would involve these new groundwater management considerations.
41

42 In addition to the water resources information provided in the Draft Solar PEIS, this
43 section provides a planning-level inventory of available climate, surface water, and groundwater
44 monitoring stations within the immediate vicinity of the Los Mogotes East SEZ and surrounding
45 basin. Additional data regarding climate, surface water, and groundwater conditions are
46 presented in Tables 10.4.9.1-1 through 10.4.9.1-7 and in Figures 10.4.9.1-1 and 10.4.9.1-2.

8
9

Fieldwork and hydrologic analyses needed to determine 100-year floodplains and jurisdictional water bodies would need to be coordinated with appropriate federal, state, and local agencies. Areas within the Los Mogotes East SEZ that are found to be within a 100-year floodplain will be identified as non-development areas. Any water features within the Los Mogotes East SEZ determined to be jurisdictional will be subject to the permitting process described in the CWA.

13
14
15
16

10.4.9.2.1 Land Disturbance Impacts on Water Resources

17
18
19
20

The discussion of land disturbance effects on water resources in the Draft Solar PEIS remains valid. As stated in the Draft Solar PEIS, land disturbance impacts in the vicinity of the proposed Los Mogotes East SEZ could potentially affect drainage patterns and groundwater recharge. The alteration of natural drainage pathways during construction can lead to impacts

2 **FIGURE 10.4.9.1-1 Surface Water Features near the Proposed Los Mogotes East SEZ as Revised**

1

2 **FIGURE 10.4.9.1-2 Surface Water and Groundwater Features within the Rio Grande Basin,**
 3 **Which Includes the Proposed Los Mogotes East SEZ as Revised**

1 related to flooding, loss of water delivery to downstream regions, and changes to riparian
2 vegetation and habitats. The alteration of the SEZ boundaries removed several
3 intermittent/ephemeral stream reaches, which reduces the potential for adverse impacts
4 associated with land disturbance activities.
5

6 Land clearing, land leveling, and vegetation removal during the development of the SEZ
7 have the potential to disrupt intermittent/ephemeral stream channels. Several programmatic
8 design features described in Section A.2.2 of Appendix A of this Final Solar PEIS would avoid,
9 minimize, and/or mitigate impacts associated with the disruption of intermittent/ephemeral water
10 features. Additional analyses of intermittent/ephemeral streams are presented in this update,
11 including an evaluation of functional aspects of stream channels with respect to groundwater
12 recharge, flood conveyance, sediment transport, geomorphology, and ecological habitats. Only a
13 summary of the results from these surface water analyses is presented in this section; more
14 information on methods and results is presented in Appendix O.
15

16 The study region considered for the intermittent/ephemeral stream evaluation relevant to
17 the Los Mogotes East SEZ is a subset of the Alamosa–Trinchera watershed (HUC8), for which
18 information regarding stream channels is presented in Tables 10.4.9.1-3 and 10.4.9.1-4 of this
19 Final Solar PEIS. The results of the intermittent/ephemeral stream evaluation are shown in
20 Figure 10.4.9.2-1, which depicts flow lines from the National Hydrography Dataset (USGS
21 2012a) labeled as low, moderate, and high sensitivity to land disturbance. Within the study area,
22 83% of the intermittent/ephemeral stream channels had low sensitivity and 17% had moderate
23 sensitivity to land disturbance. All the intermittent/ephemeral channel reaches within the
24 Los Mogotes East SEZ were classified as having low sensitivity to land disturbance, but some of
25 these channels transition to having moderate sensitivity to land disturbance immediately down-
26 gradient of the SEZ.
27
28

29 ***10.4.9.2.2 Water Use Requirements for Solar Energy Technologies*** 30

31 Changes in the Los Mogotes East SEZ boundaries resulted in changes to the estimated
32 water use requirements and a reduction in the land affected by surface disturbances. This section
33 presents changes in water use estimates for the reduced SEZ area and additional analyses
34 pertaining to groundwater. The additional analyses of groundwater include a basin-scale water
35 budget and a simplified, one-dimensional groundwater model of potential groundwater
36 drawdown. Only a summary of the results from these groundwater analyses is presented in this
37 section; more information on methods and results is presented in Appendix O.
38

39 Table 10.4.9.2-1 presents the revised estimates of water requirements for both
40 construction and operation of solar facilities at the Los Mogotes East SEZ, assuming full build-
41 out of the SEZ and accounting for its decreased size. The reduction in area of 55% has resulted
42 in an approximately equal reduction in total water use requirements.
43

44 The Los Mogotes East SEZ is located in the San Luis Valley, where both surface
45 waters and groundwater are managed conjunctively. Previous studies on water resources in the
46 San Luis Valley typically present a basin-scale water balance, which considers inputs and

 4
 5 outputs of water via precipitation, surface water flows, and groundwater (e.g., Mayo et al. 2007).
 6 Table 10.4.9.2-2 presents an example water balance for the San Luis Valley that considers all
 7 water inputs and outputs from the valley. As noted by Mayo et al. (2007), it is difficult to
 8 reconcile some of the historical water budgets presented for the San Luis Valley; however, it can
 9 generally be stated that the water budget is predominately a balance of precipitation and stream
 10 flow inputs with output dominated by evapotranspiration by agricultural lands, riparian areas,
 11 and meadows.

12
 13 The estimated total water use requirements during the peak construction year are as high
 14 as 686 ac-ft/yr (846,200 m³/yr), which does not constitute a significant amount given the short
 15 duration of this water demand relative to water resources within the region. The long duration
 16 of groundwater pumping during operations (20 years) poses a greater threat to groundwater
 17 resources. This analysis considered low, medium, and high groundwater pumping scenarios that

represent full build-out of the SEZ, assuming PV, dry-cooled parabolic trough, and wet-cooled parabolic trough, respectively (a 30% operational time was considered for all solar facility types on the basis of operations estimates for proposed utility-scale solar energy facilities). The low, medium, and high pumping scenarios result in groundwater withdrawals that range from 12 to 2,126 ac-ft/yr (14,800 to 2.6 million m³/yr), or 240 to 42,520 ac-ft (296,000 to 52.4 million m³) over the 20-year operational period. From a groundwater budgeting perspective, the high pumping scenario over the 20-year analysis period represents 2% of the groundwater storage, and its annual pumping rate is on the order of 0.3% of the current annual groundwater withdrawals in the basin. The amounts of estimated groundwater withdrawals for the low and medium pumping scenarios do not represent significant quantities in comparison to the water budget of the San Luis Valley.

18
19
20
21
22
23
24
25
26

Examining groundwater withdrawals with respect to a basin-scale water budget allows for an assessment of potential impacts only to an order of magnitude approximation of basin-scale estimates of complex groundwater processes. In addition, a water budget approach ignores the temporal and spatial components of how groundwater withdrawals affect groundwater surface elevations, groundwater flow rates, and connectivity to surface water features such as streams, wetlands, playas, and riparian vegetation. A one-dimensional groundwater modeling analysis was performed to present a simplified depiction of the spatial and temporal effects of groundwater withdrawals by examining groundwater drawdown in a radial direction around the center of the SEZ for the low, medium, and high pumping scenarios, considering pumping from

1 the upper unconfined aquifer and lower confined aquifer separately. A detailed discussion of the
 2 groundwater modeling analysis is presented in Appendix O. It should be noted, however, that the
 3 aquifer parameters used for the one-dimensional groundwater model (Table 10.4.9.2-3) represent
 4 available literature data, and that the model aggregates these value ranges into a simplistic
 5 representation of the aquifers.

6
 7 Depth to groundwater in the unconfined aquifer is typically on the order of 15 to 35 ft
 8 (5 to 11 m) in the vicinity of the Los Mogotes East SEZ, and the confined aquifer is on the order
 9 of 200 to 300 ft (61 to 91 m) below the surface. The one-dimensional groundwater modeling
 10 results for the upper unconfined aquifer suggest that groundwater drawdown in the vicinity of the
 11 SEZ (approximately a 2-mi [3.2-km] radius) ranges from up to 15 ft (5 m) for the high pumping
 12 scenario, up to 3 ft (1 m) for the medium pumping scenario, and less than 1 ft (0.3 m) for the low
 13 pumping scenario (Figure 10.4.9.2-2). The extent of groundwater drawdown is primarily
 14 restricted to the vicinity of the SEZ for all pumping scenarios. The modeling results for the lower
 15 confined aquifer suggest significant groundwater drawdown occurs for the high pumping
 16 scenario, ranging from 7 to 25 ft (9 to 24 m) and extending more than 50 mi (80 km) from the
 17

6
7
8

1 SEZ (Figure 10.4.9.2-2). The low and medium pumping scenarios have a much lower impact on
2 groundwater drawdown, from 0 to 3 ft (0 to 1 m).

3
4 The comparison of water use requirements to the basin-scale water budget and the
5 one-dimensional groundwater modeling gives mixed results. From a groundwater budgeting
6 perspective, the three pumping scenarios considered are not significant relative to the amounts
7 of water moved through the San Luis Valley. Groundwater modeling results suggest that the
8 high pumping scenario would have a localized groundwater drawdown effect if groundwater
9 were extracted from the unconfined aquifer, but a more significant impact extending more
10 than 50 mi (80 km) away from the SEZ if withdrawn from the confined aquifer. As stated
11 in Section 10.4.9.1, water management of the San Luis Valley is restrictive, given its
12 overappropriated nature in water rights and its obligations to maintain flows in the Rio Grande.
13 Ultimately, any proposed groundwater withdrawals for solar energy facilities would be reviewed
14 for impacts by the Colorado DWR and would be subject to the rules and court decisions outlined
15 in Case Numbers 06CV64 and 07CW52 (Colorado District Court 2010).

16 17 18 ***10.4.9.2.3 Off-Site Impacts: Roads and Transmission Lines***

19
20 As stated in the Draft Solar PEIS, impacts associated with the construction of roads and
21 transmission lines primarily deal with water use demands for construction, water quality
22 concerns relating to potential chemical spills, and land disturbance effects on the natural
23 hydrology. Water needed for transmission line construction activities (e.g., for soil compaction,
24 dust suppression, and potable supply for workers) could be trucked to the construction area from
25 an off-site source. If this occurred, water use impacts at the SEZ would be negligible. The Draft
26 Solar PEIS assessment of impacts on water resources from road and transmission line
27 construction remains valid.

28 29 30 ***10.4.9.2.4 Summary of Impacts on Water Resources***

31
32 The additional information and analyses of water resources presented in this update agree
33 with the information provided in the Draft Solar PEIS, which indicates that the San Luis Valley
34 is a high-elevation basin, with predominately agricultural land use, and is the headwaters of the
35 Rio Grande, where surface water and groundwater processes are coupled and managed jointly.
36 Groundwater in the San Luis Valley is found in both the upper unconfined aquifer and lower
37 confined aquifer, and historical diversions of both surface water and groundwater for irrigation
38 have affected streamflows and groundwater levels. Water management plays a significant role
39 in the San Luis Valley, because it pertains to ensuring river flows in the Rio Grande according
40 to the Rio Grande Compact, which is the primary responsibility of the Colorado DWR.

41
42 Disturbance to intermittent/ephemeral stream channels within the Los Mogotes East SEZ
43 should not have a significant impact on the critical functions of groundwater recharge, sediment
44 transport, flood conveyance, and ecological habitat, given the relatively small footprint of the
45 SEZ with respect to the study area along with the low sensitivity to land disturbances of
46 identified intermittent/ephemeral streams. Several short reaches of intermittent/ephemeral stream

1 channels with moderate sensitivity to land disturbance are located immediately downgradient of
2 the SEZ; thus reducing off-site impacts associated with runoff is an important consideration for
3 siting and construction phases. Groundwater withdrawals pose the greatest threat to water
4 resources in the San Luis Valley. The water budgeting and groundwater modeling analyses
5 suggest that significant groundwater drawdown could occur both locally and off-site under the
6 high pumping scenario if groundwater were extracted from either the unconfined or confined
7 aquifer. The low and medium pumping scenarios are preferable, because estimated groundwater
8 drawdown is much less. Ultimately, the process of transferring water rights established by the
9 Colorado DWR will determine how much water can be used by proposed solar facilities. As
10 stated in the Draft Solar PEIS, given the restrictive nature of water rights and the need for
11 augmentation water reserves, it would be difficult for any projects seeking more than
12 1,000 ac-ft/yr (1.2 million m³/yr) of water to be successful in obtaining the needed water rights
13 (McDermott 2010).

14
15 Predicting impacts associated with groundwater withdrawals is often difficult, given the
16 heterogeneity of aquifer characteristics, the long time period between the onset of pumping and
17 its effects, and limited data. Another consideration relevant to the San Luis Valley is that the
18 transfer of water rights will likely come from the purchase of existing irrigation water rights,
19 which will result in a change in the location of the point of diversion and a change in land use
20 patterns in the basin, both of which can affect groundwater processes. One of the primary
21 mitigation measures to protect water resources is the implementation of long-term monitoring
22 and adaptive management (see Section A.2.4 of Appendix A). For groundwater, this requires a
23 combination of monitoring and modeling to fully identify the temporal and spatial extent of
24 potential impacts. Water management in the San Luis Valley relies on several water monitoring
25 and modeling tools developed by the Colorado DWR and the CWCB that are a part of the
26 Colorado's Decision Support Systems (available at [http://cdss.state.co.us/Pages/](http://cdss.state.co.us/Pages/CDSSHome.aspx)
27 [CDSSHome.aspx](http://cdss.state.co.us/Pages/CDSSHome.aspx)), and these tools should be implemented with respect to long-term monitoring
28 and adaptive management strategies for solar energy development occurring within the San Luis
29 Valley.

30 31 32 **10.4.9.3 SEZ-Specific Design Features and Design Feature Effectiveness**

33
34 Required programmatic design features that would reduce impacts on surface water
35 and groundwater are described in Section A.2.2 of Appendix A of this Final Solar PEIS.
36 Implementing the programmatic design features will provide some protection of and reduce
37 impacts on water resources.

38
39 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
40 analyses, and consideration of comments received as applicable, the following SEZ-specific
41 design feature has been identified:

- 42
43 • Groundwater analyses suggest full build-out of wet-cooled technologies is not
44 feasible; for mixed-technology development scenarios, any proposed wet-
45 cooled projects would have to reduce water requirements to less than

1 approximately 1,000 ac-ft/yr (1.2 million m³/yr) in order to secure water
2 rights and comply with water management in the San Luis Valley.
3

4 The need for additional SEZ-specific design features will be identified through the
5 process of preparing parcels for competitive offer and subsequent project-specific analysis.
6

7 8 **10.4.10 Vegetation**

9 10 11 **10.4.10.1 Affected Environment**

12
13 As presented in Section 10.4.10.1 of the Draft Solar PEIS, 5 cover types were identified
14 within the area of the proposed Los Mogotes East SEZ, 12 cover types were identified within the
15 access road corridor, and 26 cover types were identified within 5 mi (8 km) of the SEZ boundary
16 (the indirect impact area). Sensitive habitats on the SEZ include ephemeral washes. Because of
17 the SEZ boundary changes, the Inter-Mountain Basins Mixed Salt Desert Scrub cover type no
18 longer occurs within the SEZ. Figure 10.4.10.1-1 shows the cover types within the affected area
19 of the Los Mogotes East SEZ as revised.
20

21 22 **10.4.10.2 Impacts**

23
24 As presented in the Draft Solar PEIS, the construction of solar energy facilities within the
25 proposed Los Mogotes East SEZ would result in direct impacts on plant communities because of
26 the removal of vegetation within the facility footprint during land-clearing and land-grading
27 operations. Approximately 80% of the SEZ would be expected to be cleared with full
28 development of the SEZ. As a result of the new configuration of the SEZ boundary,
29 approximately 2,120 acres (8.58 km²) would be cleared.
30

31 Overall impact magnitude categories were based on professional judgment and include
32 (1) *small*: a relatively small proportion ($\leq 1\%$) of the cover type within the SEZ region would be
33 lost; (2) *moderate*: an intermediate proportion (> 1 but $\leq 10\%$) of a cover type would be lost; and
34 (3) *large*: $> 10\%$ of a cover type would be lost.
35

36 37 **10.4.10.2.1 Impacts on Native Species**

38
39 The analysis presented in the Draft Solar PEIS for the original Los Mogotes East SEZ
40 developable area indicated that development would result in a moderate impact on one land
41 cover type and a small impact on all other land cover types occurring within the SEZ
42 (Table 10.4.10.1-1 in the Draft Solar PEIS). Development within the revised Los Mogotes East
43 SEZ could still directly affect most of the cover types evaluated in the Draft Solar PEIS, with the
44 exception of Inter-Mountain Basins Mixed Salt Desert Scrub (previously a moderate impact); the
45 reduction in the developable area would result in reduced (and still small) impact levels on all
46 other cover types in the affected area.

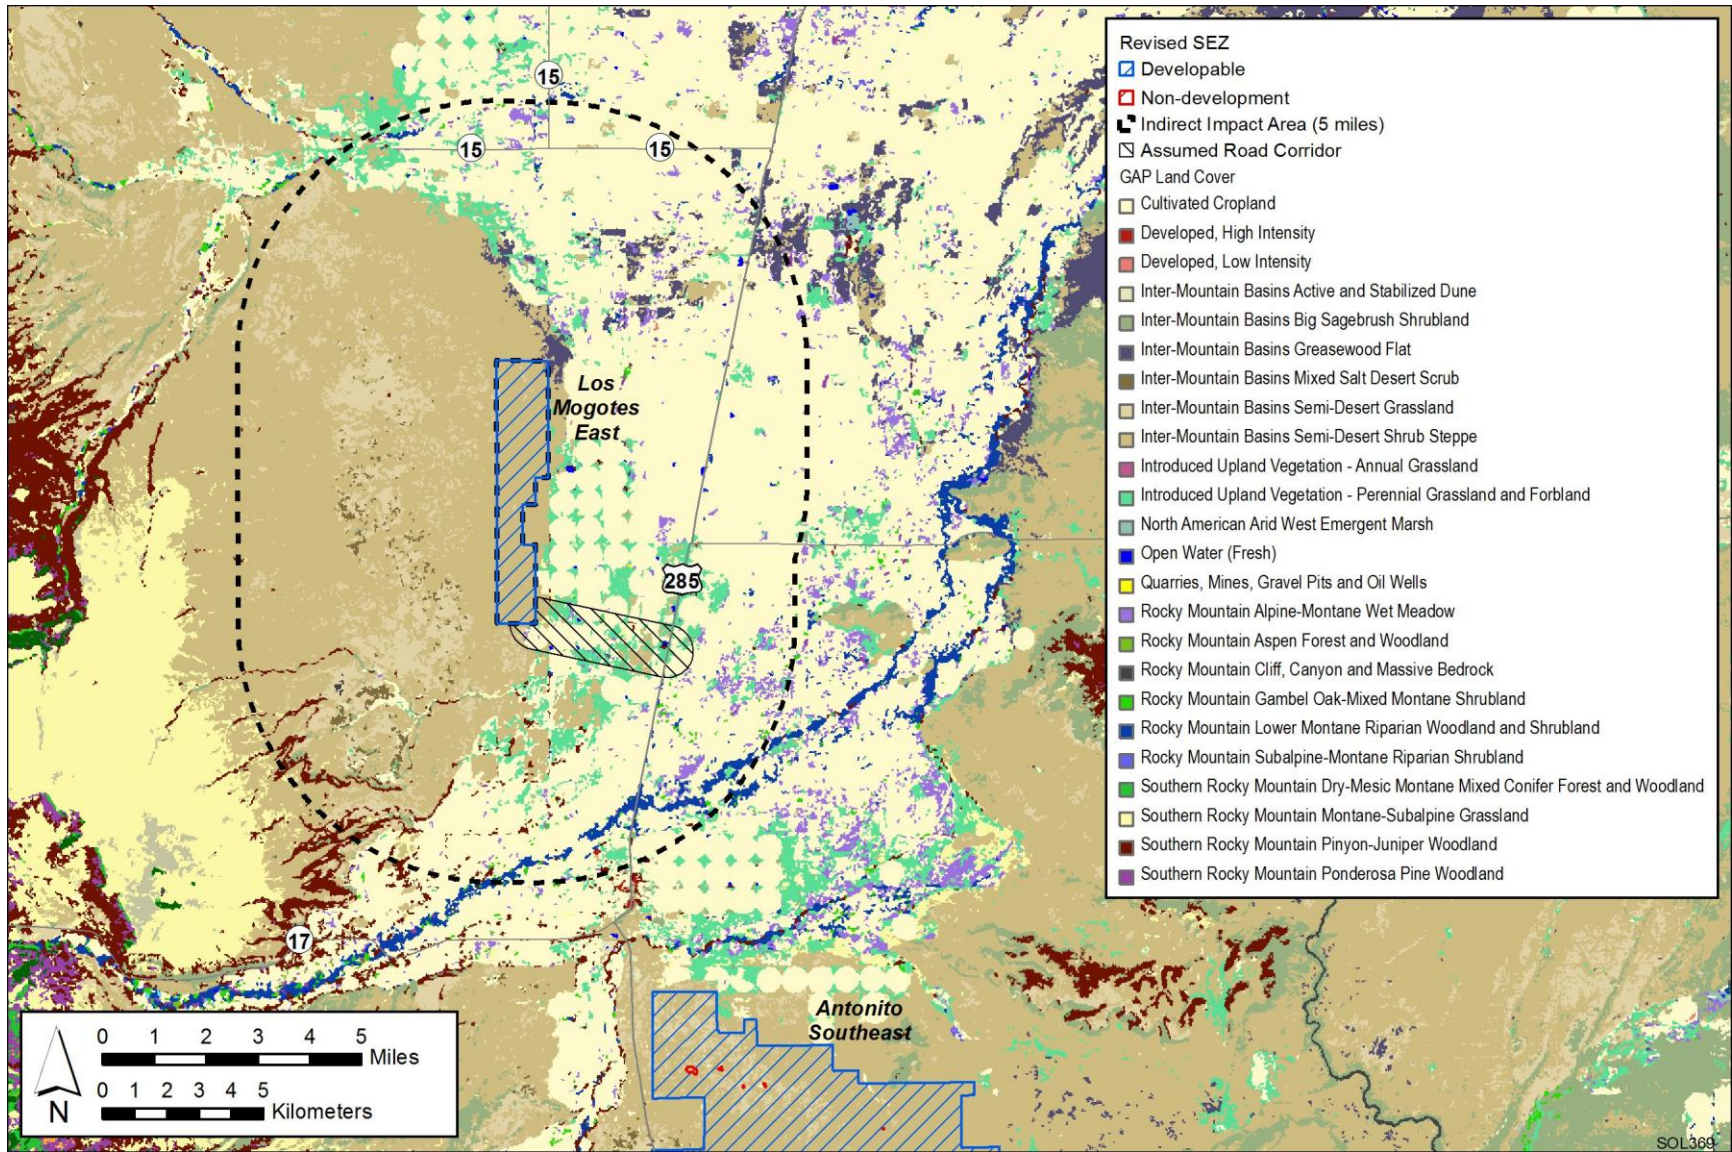

FIGURE 10.4.10.1-1 Land Cover Types within the Proposed Los Mogotes East SEZ as Revised

1 Direct impacts could still occur on unmapped wetlands within the remaining developable
2 areas of the SEZ. In addition, indirect impacts on wetlands within or near the SEZ, as described
3 in the Draft Solar PEIS, could occur.
4

6 ***10.4.10.2.2 Impacts from Noxious Weeds and Invasive Plant Species***

7

8 As presented in the Draft Solar PEIS, land disturbance from project activities and indirect
9 effects of construction and operation within the Los Mogotes East SEZ could potentially result in
10 the establishment or expansion of noxious weeds and invasive species populations, potentially
11 including those species listed in Section 10.4.10.1 in the Draft Solar PEIS. Impacts, such as
12 reduced restoration success and possible widespread habitat degradation, could still occur;
13 however, a small reduction in the potential for such impacts would result from the reduced
14 developable area of the SEZ.
15

17 **10.4.10.3 SEZ-Specific Design Features and Design Feature Effectiveness**

18

19 Required programmatic design features are described in Section A.2.2 of Appendix A
20 of this Final Solar PEIS. SEZ-specific species and habitats will determine how programmatic
21 design features are applied, for example:
22

- 23 • All dry wash habitats within the SEZ and all wetland and dry wash habitats
24 within the assumed access road corridor shall be avoided to the extent
25 practicable, and any impacts minimized and mitigated in consultation with
26 appropriate agencies. A buffer area shall be maintained around wetlands and
27 dry washes to reduce the potential for impacts on these habitats on or near
28 the SEZ.
29
- 30 • Appropriate engineering controls shall be used to minimize impacts on
31 wetland, dry wash, and riparian habitats, including downstream occurrences,
32 resulting from surface water runoff, erosion, sedimentation, altered hydrology,
33 accidental spills, or fugitive dust deposition to these habitats. Maintaining
34 sediment and erosion controls along drainages would reduce the potential for
35 impacts on wetlands near or downgradient from the SEZ. Appropriate buffers
36 and engineering controls will be determined through agency consultation.
37
- 38 • Groundwater withdrawals shall be limited to reduce the potential for indirect
39 impacts on wetland habitats or springs that are associated with groundwater
40 discharge, such as the wetlands along the Conejos River.
41

42 It is anticipated that implementation of these programmatic design features will reduce a
43 high potential for impacts from invasive species and impacts on wetlands, springs, dry washes,
44 and riparian habitats to a minimal potential for impact. Residual impacts on wetlands could result
45 from remaining groundwater withdrawal and so forth; however, it is anticipated that these
46 impacts would be avoided in the majority of instances.

1 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
2 analyses due to changes to the SEZ boundaries, and consideration of comments received as
3 applicable, no SEZ-specific design features have been identified. Some SEZ-specific design
4 features may be identified through the process of preparing parcels for competitive offer and
5 subsequent project-specific analysis.
6
7

8 **10.4.11 Wildlife and Aquatic Biota**

9

10 For the assessment of potential impacts on wildlife and aquatic biota, overall impact
11 magnitude categories were based on professional judgment and include (1) *small*: a relatively
12 small proportion ($\leq 1\%$) of the species' habitat within the SEZ region would be lost;
13 (2) *moderate*: an intermediate proportion (> 1 but $\leq 10\%$) of the species' habitat would be lost;
14 and (3) *large*: $> 10\%$ of the species' habitat would be lost.
15
16

17 **10.4.11.1 Amphibians and Reptiles**

18
19

20 ***10.4.11.1.1 Affected Environment***

21

22 As presented in the Draft Solar PEIS, representative amphibian and reptile species
23 expected to occur within the Los Mogotes East SEZ include the Woodhouse's toad (*Bufo*
24 *woodhousii*), fence lizard (*Sceloporus undulatus*), gopher snake (*Pituophis catenifer*), western
25 rattlesnake (*Crotalus viridis*), short-horned lizard (*Phrynosoma hernandesi*), and western
26 terrestrial garter snake (*Thamnophis elegans*). The reduction in the size of the Los Mogotes East
27 SEZ does not alter the potential for these species to occur in the affected area.
28
29

30 ***10.4.11.1.2 Impacts***

31

32 As presented in the Draft Solar PEIS, solar energy development within the Los Mogotes
33 East SEZ could affect potentially suitable habitats for several amphibian and reptile species. The
34 analysis presented in the Draft Solar PEIS indicated that development would result in a small
35 overall impact on representative amphibian and reptile species (Table 10.4.11.1-1 in the Draft
36 Solar PEIS). Development within the revised boundaries of the Los Mogotes East SEZ could still
37 affect the same species evaluated in the Draft Solar PEIS; however, the reduction in the
38 developable area would result in reduced (and still small) impact levels compared to original
39 estimates in the Draft Solar PEIS.
40
41

42 ***10.4.11.1.3 SEZ-Specific Design Features and Design Feature Effectiveness***

43

44 Required programmatic design features that will reduce impacts on amphibian and reptile
45 species are described in Section A.2.2 of Appendix A of this Final Solar PEIS. SEZ-specific

1 species and habitats will guide how programmatic design features for amphibians and reptiles are
2 applied, for example:

- 3
- 4 • Wash habitats within the SEZ shall be avoided to the extent practicable.
- 5
- 6 • Appropriate engineering controls shall be used to minimize impacts on
7 palustrine wetlands surrounding the SEZ resulting from surface water runoff,
8 erosion, sedimentation, accidental spills, or fugitive dust deposition to these
9 habitats.

10
11 With the implementation of required programmatic design features, impacts on
12 amphibian and reptile species would be reduced.

13
14 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
15 analyses due to changes to the SEZ boundaries, and consideration of comments received as
16 applicable, the following SEZ-specific design feature has been identified:

- 17
- 18 • The access road should be sited and constructed to minimize impacts on
19 wetlands (if present within the finalized access road location).
- 20

21 If SEZ-specific design features are implemented in addition to required programmatic
22 design features, impacts on amphibian and reptile species would be small. The need for
23 additional SEZ-specific design features will be identified through the process of preparing
24 parcels for competitive offer and subsequent project-specific analysis.

25 26 27 **10.4.11.2 Birds**

28 29 30 ***10.4.11.2.1 Affected Environment***

31
32 As presented in the Draft Solar PEIS, a large number of bird species could occur or have
33 potentially suitable habitat within the affected area of the proposed Los Mogotes East SEZ.
34 Representative bird species identified in the Draft Solar PEIS included Brewer's blackbird
35 (*Euphagus cyanocephalus*), Brewer's sparrow (*Spizella breweri*), common nighthawk
36 (*Chordeiles minor*), horned lark (*Eremophila alpestris*), vesper sparrow (*Pooecetes gramineus*),
37 western meadowlark (*Sturnella neglecta*), American kestrel (*Falco sparverius*), golden eagle
38 (*Aquila chrysaetos*), red-tailed hawk (*Buteo jamaicensis*), short-eared owl (*Asio flammeus*),
39 Swainson's hawk (*Buteo swainsoni*), turkey vulture (*Cathartes aura*), and mourning dove
40 (*Zenaidura macroura*). The reduction in the size of the reconfigured Los Mogotes East SEZ does
41 not alter the potential for these species or other bird species to occur in the affected area.

42 43 44 ***10.4.11.2.2 Impacts***

45
46 As presented in the Draft Solar PEIS, solar energy development within the Los Mogotes
47 East SEZ could affect potentially suitable habitats of bird species. The analysis presented in the

1 Draft Solar PEIS for the original Los Mogotes East SEZ boundaries indicated that development
2 would result in a small overall impact on the representative bird species (Table 10.4.11.2-1 in the
3 Draft Solar PEIS). Development within the revised boundaries of the Los Mogotes East SEZ
4 could still affect the same species evaluated in the Draft Solar PEIS; however, the reduction in
5 the developable area would result in reduced (and still small) impact levels compared to original
6 estimates in the Draft Solar PEIS.

9 ***10.4.11.2.3 SEZ-Specific Design Features and Design Feature Effectiveness***

10
11 Required programmatic design features that would reduce impacts on bird species are
12 described in Section A.2.2 of Appendix A of this Final Solar PEIS. SEZ-specific species and
13 habitats will determine how programmatic design features are applied, for example:

- 14
15 • Appropriate engineering controls shall be used to minimize impacts resulting
16 from surface water runoff, erosion, sedimentation, accidental spills, or fugitive
17 dust deposition.

18
19 If the programmatic design features are implemented, impacts on bird species will be
20 reduced.

21
22 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
23 analyses due to changes to the SEZ boundaries, and consideration of comments received as
24 applicable, the following SEZ-specific design features have been identified:

- 25
26 • The access road should be sited and constructed to minimize impacts on
27 wetlands and riparian areas (if present within the finalized access road
28 location).
- 29
30 • If present, prairie dog colonies (which could provide habitat or a food source
31 for some raptor species) should be avoided to the extent practicable. This
32 design feature has been at least partly met as the revised SEZ now avoids
33 known Gunnison prairie dog habitat.

34
35 If these SEZ-specific design features are implemented in addition to required
36 programmatic design features, impacts on bird species would be small. The need for additional
37 SEZ-specific design features will be identified through the process of preparing parcels for
38 competitive offer and subsequent project-specific analysis.

39 40 41 **10.4.11.3 Mammals**

42 43 44 ***10.4.11.3.1 Affected Environment***

45
46 As presented in the Draft Solar PEIS, a large number of mammal species were identified
47 that could occur or have potentially suitable habitat within the affected area of the proposed

1 Los Mogotes East SEZ. Representative mammal species identified in the Draft Solar PEIS
2 included (1) big game species: the American black bear (*Ursus americanus*), bighorn sheep
3 (*Ovis canadensis*), cougar (*Puma concolor*), elk (*Cervis canadensis*), mule deer (*Odocoileus*
4 *hemionus*), and pronghorn (*Antilocapra americana*); (2) furbearers and small game species:
5 the American badger (*Taxidea taxus*), coyote (*Canis latrans*), desert cottontail (*Sylvilagus*
6 *audubonii*), red fox (*Vulpes vulpes*), striped skunk (*Mephitis mephitis*), and white-tailed
7 jackrabbit (*Lepus townsendii*); and (3) small nongame species: the big brown bat (*Eptesicus*
8 *fuscus*), deer mouse (*Peromyscus maniculatus*), least chipmunk (*Tamias minimus*), little brown
9 myotis (*Myotis lucifugus*), northern pocket gopher (*Thomomys talpoides*), Ord's kangaroo rat
10 (*Dipodomys ordii*), thirteen-lined ground squirrel (*Spermophilus tridecemlineatus*), and western
11 small-footed myotis (*Myotis ciliolabrum*). The reduction in the size of the Los Mogotes East
12 SEZ does not alter the potential for these species or any additional mammal species to occur in
13 the affected area.

14 15 16 **10.4.11.3.2 Impacts** 17

18 As presented in the Draft Solar PEIS, solar energy development within the Los Mogotes
19 East SEZ could affect potentially suitable habitats of mammal species. The analysis presented
20 in the Draft Solar PEIS for the original Los Mogotes East SEZ boundaries indicated that
21 development would result in a small overall impact on all representative mammal species
22 analyzed (Table 10.4.11.3-1 in the Draft Solar PEIS). Development within the revised
23 boundaries of the Los Mogotes East SEZ could still affect the same representative mammal
24 species evaluated in the Draft Solar PEIS; however, the reduction in the developable area
25 would result in reduced (and still small) impact levels compared to original estimates in the
26 Draft Solar PEIS.

27
28 Based on mapped activity areas, direct potential loss of overall range, winter range, and
29 severe winter range for elk; overall range for mule deer; and overall range and severe winter
30 range for pronghorn would be reduced from 4,734 acres (19.2 km²) to 2,120 acres (8.6 km²) for
31 the revised Los Mogotes East SEZ. Impact levels for these activity areas would still be small,
32 except for pronghorn severe winter range, where the impact would remain moderate. The
33 135 acres (0.5 km²) of mule deer winter range and all or most of the 3,145 acres (12.7 km²) of
34 pronghorn winter concentration area potentially directly affected by solar development for the
35 original Los Mogotes East SEZ boundaries in the Draft Solar PEIS would not be affected for the
36 revised SEZ, because these activity areas are wholly or mostly within the acreage eliminated
37 from the SEZ, respectively.

38 39 40 **10.4.11.3.3 SEZ-Specific Design Features and Design Feature Effectiveness** 41

42 Required programmatic design features that would reduce impacts on mammal species
43 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. With implementation of
44 required programmatic design features, impacts on mammal species would be reduced.
45

1 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
2 analyses due to changes to the SEZ boundaries, and consideration of comments received as
3 applicable, the following SEZ-specific design features for mammals have been identified.

- 4
- 5 • Development in the 135-acre (0.55-km²) portion of the SEZ that overlaps the
6 mule deer winter range should be avoided. This design feature is no longer
7 applicable as the revised SEZ now avoids this mule deer activity area.
8
- 9 • Prairie dog colonies should be avoided to the extent practicable to reduce
10 impacts on species such as desert cottontail and thirteen-lined ground squirrel.
11 This design feature has been at least partly met, as the revised SEZ now
12 avoids known Gunnison prairie dog habitat.
13
- 14 • Construction should be curtailed during winter when big game species are
15 present.
16
- 17 • Where big game winter ranges intersect or are close to the SEZ, motorized
18 vehicles and other human disturbances should be controlled (e.g., through
19 temporary road closures when big game are present).
20
- 21 • Loss of pronghorn winter concentration area should be minimized. This
22 design feature has largely been met, as the revised SEZ now avoids all or most
23 of this pronghorn activity area.
24

25 The need for additional SEZ-specific design features will be identified through the
26 process of preparing parcels for competitive offer and subsequent project-specific analysis.

27

28

29 **10.4.11.4 Aquatic Biota**

30

31

32 ***10.4.11.4.1 Affected Environment***

33

34 There are no permanent water bodies or perennial streams within the boundaries of the
35 proposed Los Mogotes East SEZ or the area of indirect effects, although rain events may give
36 rise to ephemeral pools on occasion. A number of ephemeral washes pass through the SEZ but
37 do not extend directly to nearby perennial streams. The boundaries of the Los Mogotes East SEZ
38 have been reduced compared to the boundaries given in the Draft Solar PEIS. Based on these
39 changes, updates to the Draft Solar PEIS include the following:

- 40
- 41 • Approximately 16 mi (26 km) of perennial stream habitat associated with
42 three streams falls within the assumed area of indirect effects within 5 mi
43 (8 km) of the SEZ, including approximately 7 mi (11 km) of the lower portion
44 of La Jara Creek, a 5-mi (8-km) section of the Conejos River, and a 3-mi
45 (5-km) segment of the lower Alamosa River.
46

- 1 • Outside of the area of indirect effects but within 50 mi (80 km) of the SEZ,
2 there are approximately 869 mi (1,938 km) of perennial streams, 198 mi
3 (319 km) of intermittent streams, and 177 mi (285 km) of canals.
4
- 5 • There are approximately 10,725 acres (4,340 km²) of lake and reservoir
6 habitat within 50 mi (80 km) of the SEZ. There are no lakes or reservoirs
7 within the areas considered for analysis of direct or indirect effects. The
8 nearest such habitat is La Jara Reservoir, approximately 11 mi (17 km) to
9 the southeast of the SEZ.

10
11 Aquatic biota present the SEZ have not been characterized. As stated in Appendix C of
12 the Supplement to the Draft Solar PEIS, site surveys can be conducted at the project-specific
13 level to characterize the aquatic biota, if present, in washes, dry lakes, and wetlands within the
14 SEZ.

15 16 17 ***10.4.11.4.2 Impacts*** 18

19 The types of impacts that could occur on aquatic habitats and biota from development of
20 utility-scale solar energy facilities are identified in Section 5.10.2.4 of the Draft Solar PEIS and
21 this Final Solar PEIS. Aquatic habitats present on or near the Los Mogotes East SEZ could be
22 affected by solar energy development in a number of ways, including (1) direct disturbance,
23 (2) deposition of sediments, (3) changes in water quantity, and (4) degradation of water quality.
24 The impact assessment provided in the Draft Solar PEIS remains valid, with the following
25 update:
26

- 27 • The amount of surface water features within the SEZ and in the area of
28 indirect effects that could potentially be affected by solar energy development
29 is less because the size of the SEZ has been reduced.
30
31

32 ***10.4.11.4.3 SEZ-Specific Design Features and Design Feature Effectiveness*** 33

34 Required programmatic design features that would reduce impacts on aquatic species are
35 described in Section A.2.2 of Appendix A of this Final Solar PEIS. SEZ-specific resources and
36 conditions will guide how programmatic design features are applied, for example:
37

- 38 • Undisturbed buffer areas and sediment and erosion controls shall be
39 maintained around drainages associated with wetland areas located in the
40 immediate vicinity of the SEZ.
41

42 It is anticipated that implementation of the programmatic design features will reduce
43 impacts on aquatic biota, and if the utilization of water from groundwater or surface water
44 sources is adequately controlled to maintain sufficient water levels in nearby aquatic habitats, the
45 potential impacts on aquatic biota from solar energy development at the Los Mogotes East SEZ
46 would be negligible.

1 On the basis of the impact analyses conducted for the Draft Solar PEIS, updates to those
2 analyses due to changes to the SEZ boundaries, and consideration of comments received as
3 applicable, no SEZ-specific design features for aquatic biota have been identified. Some SEZ-
4 specific design features may be identified through the process of preparing parcels for
5 competitive offer and subsequent project-specific analysis.
6
7

8 **10.4.12 Special Status Species**

9

10 **10.4.12.1 Affected Environment**

11

12
13 There were 51 special status species identified in the Draft Solar PEIS that could occur or
14 have potentially suitable habitat within the affected area of the proposed Los Mogotes East SEZ.
15 The reduction in the size of the Los Mogotes East SEZ does not alter the potential for these
16 species to occur in the affected area.
17

18 Since publication of the Draft Solar PEIS, three additional special status species have
19 been identified—Mexican spotted owl (*Strix occidentalis lucida*), western yellow-billed cuckoo
20 (*Coccyzus americanus occidentalis*), and fringed myotis (*Myotis thysanodes*)—that could occur
21 in the affected area of the Los Mogotes East SEZ based on known occurrences and the presence
22 of potentially suitable habitat. These three additional species are discussed in the remainder of
23 this section.
24

25 Following the publication of the Draft Solar PEIS, the BLM conducted field surveys for
26 special status bat species, as well as Gunnison prairie dog (*Cynomys gunnisoni*) and western
27 burrowing owl (*Athene cunicularia*), in the Los Mogotes East SEZ. Surveys for bat species were
28 conducted in the SEZ by using passive and active acoustic monitoring techniques at various
29 times between June 16, 2011, and October 15, 2011 (Rodriguez 2011). The big free-tailed bat
30 (*Nyctinomops macrotis*) was the only special status bat species recorded on the SEZ. However,
31 the documented presence of the fringed myotis in the De Tilla Gulch SEZ suggests that the
32 fringed myotis could occur throughout the San Luis Valley and potentially within the
33 Los Mogotes East SEZ. No roosting habitat for this species was observed on the SEZ
34 (Rodriguez 2011).
35

36 Field surveys for Gunnison prairie dog and western burrowing owl were conducted on
37 July 26, 2011 (Garcia and Harvey 2011). No Gunnison prairie dog activity was recorded in any
38 portion of the SEZ. However, there are established Gunnison prairie dog colonies within 2 mi
39 (3 km) north of the SEZ. Burrowing owls were not recorded on the SEZ during the field surveys.
40 However, burrowing owls were observed among prairie dog colonies on Colorado state land
41 within 3 mi (2 km) north of the SEZ. On June 4, 2008, a burrowing owl was observed
42 approximately 1 mi (1.6 km) west of the Los Mogotes East SEZ. On the basis of this
43 information, the Los Mogotes East SEZ could be utilized by the western burrowing owl for
44 either nesting or foraging habitat (Garcia and Harvey 2011).
45
46

1 **Mexican Spotted Owl.** The Mexican spotted owl was listed as a threatened species under
2 the ESA on March 16, 1993 (USFWS 1993). Critical habitat for this species was designated on
3 June 6, 1995 (USFWS 1995), but several court rulings resulted in the USFWS removing the
4 critical habitat designation on March 25, 1998 (USFWS 1998). In March 2000, the USFWS was
5 ordered by the courts to propose critical habitat, resulting in the current designation that includes
6 4.6 million acres (18,616 km²) in Arizona, Colorado, New Mexico, and Utah on federal lands
7 (USFWS 2004). A recovery plan for the Mexican spotted owl was published in December 1995
8 and later revised in June 2011 (USFWS 2011). At the time of federal listing in 1993, the total
9 population of Mexican spotted owls was estimated at 2,100.

10
11 The Mexican spotted owl occurs from southern British Columbia, Canada, to central
12 Mexico. The primary habitat of the spotted owl is steep rocky canyons, although mature
13 coniferous forests are also important habitat. The spotted owl occupies closed canopy forests in
14 steep canyons with uneven-aged tree stands with high basal area, with an abundance of snags and
15 downed logs (NatureServe 2010; USFWS 2011).

16
17 The Mexican spotted owl feeds mainly on rodents but also consumes rabbits, birds,
18 reptiles, and insects. Nest sites are in trees (typically those with broken tops), tree trunk cavities,
19 and cliffs along canyon walls. Breeding takes place in the spring (March) with egg-laying in late
20 March or early April. After a 30-day incubation period, hatching occurs and fledging takes place
21 in 4 to 5 weeks. The young depend on the adults for food in the summer and eventually disperse
22 from the nesting area in the fall (NatureServe 2010; USFWS 2011).

23
24 The Mexican spotted owl is known to occur in Conejos County, Colorado, and
25 potentially suitable habitat for this species may occur in the affected area of the Los Mogotes
26 East SEZ. Potentially suitable habitat for this species does not occur on the SEZ. However,
27 the SWReGAP habitat suitability model for the spotted owl (*S. occidentalis*) identified
28 approximately 14 acres (<0.1 km²) of potentially suitable habitat within the assumed access road
29 corridor and an additional 3,000 acres (12 km²) of potentially suitable habitat within the area of
30 indirect effects (Figure 10.4.12.1-1; Table 10.4.12.1-1). Designated critical habitat for the
31 Mexican spotted owl does not occur in the affected area.

32
33
34 **Western Yellow-Billed Cuckoo.** The western yellow-billed cuckoo is a candidate for
35 listing under the ESA and has the potential to occur in the affected area. The western yellow-
36 billed cuckoo is a neotropical migrant bird that inhabits large riparian woodlands in the western
37 United States. This species is not known to occur in Conejos County, Colorado, but it has been
38 documented in nearby counties such as La Plata and Rio Grande Counties, Colorado. Although
39 the SWReGAP habitat suitability model for the western yellow-billed cuckoo does not identify
40 any suitable habitat for this species within the SEZ or assumed access road corridor,
41 approximately 215 acres (1 km²) of potentially suitable riparian habitat occurs within the area of
42 indirect effects along the Conejos River (Figure 10.4.12.1-1; Table 10.4.12.1-1). Potentially
43 suitable habitat may also occur in the area of indirect effects along La Jara Creek. Additional
44 basic information on life history, habitat needs, and threats to populations of this species is
45 provided in Appendix J.

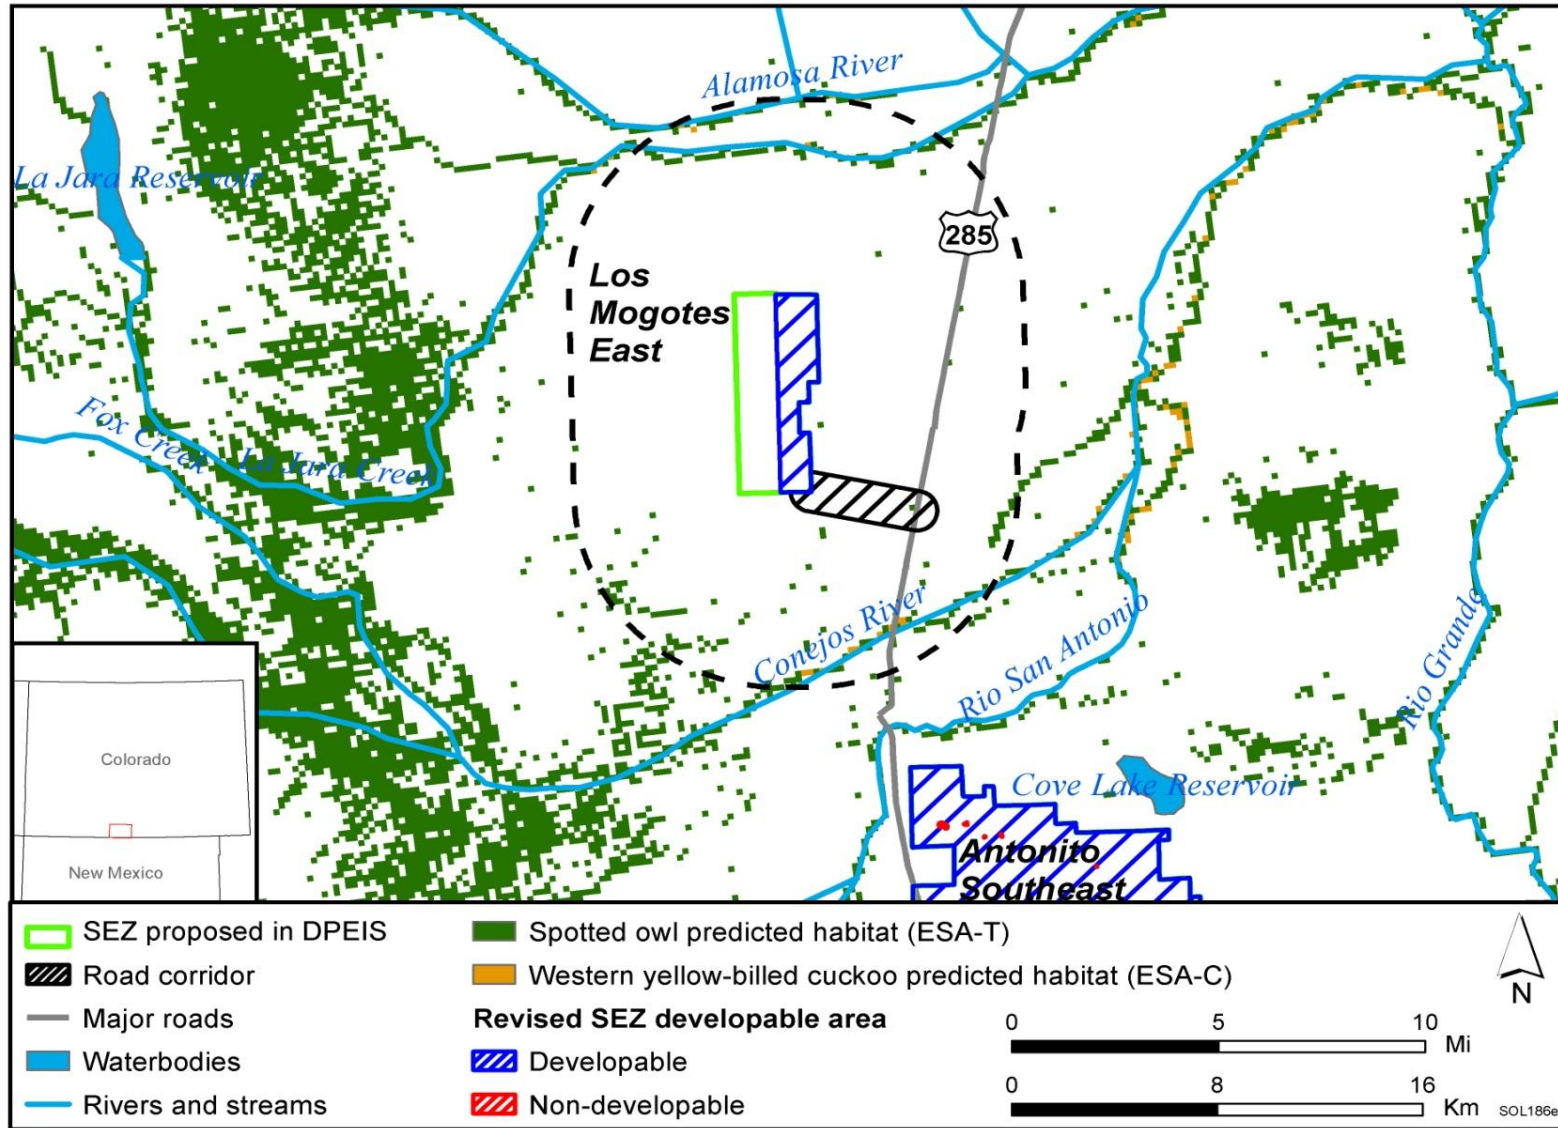

FIGURE 10.4.12.1-1 Developable Area for the Proposed Los Mogotes East SEZ as Revised and Distribution of Potentially Suitable Habitat for the Mexican Spotted Owl and Western Yellow-Billed Cuckoo

1 **TABLE 10.4.12.1-1 Habitats, Potential Impacts, and Potential Mitigation for Additional Special Status Species That Could Be**
 2 **Affected by Solar Energy Development on the Proposed Los Mogotes East SEZ as Revised^a**

Common Name	Scientific Name	Listing Status ^b	Habitat ^c	Maximum Area of Potential Habitat Affected ^d			Overall Impact Magnitude ^h and Species-Specific Mitigation ⁱ
				Within SEZ (Direct Effects) ^e	Road Corridor (Direct Effects) ^f	Outside SEZ (Indirect Effects) ^g	
Birds							
Mexican spotted owl	<i>Strix occidentalis lucida</i>	ESA-T; CO-T; CO-S1	Inhabits deep, sheer-walled canyons in old-age, mixed coniferous forests. Known to occur in Conejos County, Colorado. About 679,500 acres ^j of potentially suitable habitat occurs in the SEZ region.	0 acres	14 acres of potentially suitable habitat lost (<0.1% of available potentially suitable habitat)	3,000 acres of potentially suitable habitat (0.4% of available potentially suitable habitat)	Small overall impact; no direct impact. No species-specific mitigation is warranted.
Western yellow-billed cuckoo	<i>Coccyzus americanus occidentalis</i>	ESA-C	Breeds in scattered areas along the lower Colorado River and larger bodies of water in the southwestern United States. Primarily associated with riparian cottonwood and willow forests with dense understory foliage. Known to occur in Conejos County, Colorado. About 2,500 acres of potentially suitable habitat occurs in the SEZ region.	0 acres	0 acres	215 acres of potentially suitable habitat (8.6% of available potentially suitable habitat)	Small overall impact; no direct impact. Avoiding or limiting groundwater withdrawals for solar energy development on the SEZ could reduce impacts on this species.
Mammals							
Fringed myotis	<i>Myotis thysanodes</i>	BLM-S; FWS-SC	Summer or year-round resident in wide range of habitats, including woodland, riparian, and shrubland habitats. Roosts in caves, crevices, and buildings. About 3,484,000 acres of potentially suitable habitat occurs within the SEZ region.	2,650 acres of potentially suitable habitat lost (<0.1% of available potentially suitable habitat)	24 acres of potentially suitable habitat lost (<0.1% of available potentially suitable habitat)	86,500 acres of potentially suitable habitat (2.5% of available potentially suitable habitat)	Small overall impact; direct impact on foraging habitat only. Avoidance of direct impacts on foraging habitat is not feasible because suitable foraging habitat is widespread in the area of direct effects.

TABLE 10.4.12.1-1 (Cont.)

-
- ^a The species presented in this table represent new species identified following publication of the Draft Solar PEIS or a re-evaluation of those species that were determined to have moderate or large impacts in the Draft Solar PEIS. The other special status species for this SEZ are identified in Table 10.4.12.1-1 of the Draft Solar PEIS.
- ^b BLM-S = listed as a sensitive species by the BLM; CO-S1 = ranked as S1 in the state of Colorado; CO-T = listed as threatened in the state of Colorado; ESA-C = candidate for listing under the ESA; ESA-T = listed as threatened under the ESA; FWS-SC = USFWS species of concern.
- ^c Potentially suitable habitat was determined using SWReGAP habitat suitability models (USGS 2007). Area of potentially suitable habitat for each species is presented for the SEZ region, which is defined as the area within 50 mi (80 km) of the SEZ center.
- ^d Maximum area of potentially suitable habitat that could be affected relative to availability within the SEZ region. Habitat availability for each species within the region was determined by using SWReGAP habitat suitability models (USGS 2007). This approach probably overestimates the amount of suitable habitat in the project area.
- ^e Direct effects within the SEZ consist of the ground-disturbing activities associated with construction and the maintenance of an altered environment associated with operations.
- ^f For access road development, direct effects were estimated within a 60-ft (18-m) wide, 3-mi (5-km) long access road from the SEZ to the nearest state highway. Direct impacts within this area were determined from the proportion of potentially suitable habitat within the 1-mi (1.6-km) wide road corridor.
- ^g Area of indirect effects was assumed to be the area adjacent to the SEZ within 5 mi (8 km) of the SEZ boundary and the portion of the access road corridor where ground-disturbing activities would not occur. Indirect effects include effects from surface runoff, dust, noise, lighting, and so on from facilities. The potential degree of indirect effects would decrease with increasing distance away from the SEZ.
- ^h Overall impact magnitude categories were based on professional judgment and include (1) *small*: ≤1% of the population or its habitat would be lost, and the activity would not result in a measurable change in carrying capacity or population size in the affected area; (2) *moderate*: >1 but ≤10% of the population or its habitat, would be lost and the activity would result in a measurable but moderate (not destabilizing) change in carrying capacity or population size in the affected area; and (3) *large*: >10% of a population or its habitat would be lost and the activity would result in a large, measurable, and destabilizing change in carrying capacity or population size in the affected area. Note that much greater weight was given to the magnitude of direct effects because those effects would be difficult to mitigate. Programmatic design features would reduce most indirect effects to negligible levels.
- ⁱ Species-specific mitigations are suggested here, but final mitigations should be developed in consultation with state and federal agencies and should be based on pre-disturbance surveys.
- ^j To convert acres to km², multiply by 0.004047.

1 **Fringed Myotis.** The fringed myotis is a year-round resident in western Colorado,
2 where it forages in a variety of habitats including ponderosa pine woodlands, greasewood flats,
3 oakbrush, and shrublands. This species was not evaluated for the Los Mogotes East SEZ in the
4 Draft Solar PEIS. The species roosts in caves, rock crevices, or buildings. The fringed myotis
5 was not recorded on the Los Mogotes East SEZ during field surveys conducted in 2011
6 (Rodriguez 2011). However, fringed myotis was recorded on the De Tilla Gulch SEZ,
7 suggesting that the species could occur elsewhere in the San Luis Valley and potentially within
8 the Los Mogotes East SEZ. According to the SWReGAP habitat suitability model, potentially
9 suitable foraging habitat for the fringed myotis could occur on the SEZ and throughout portions
10 of the area of indirect effects (Table 10.4.12.1-1). There is no potentially suitable roosting habitat
11 (rocky cliffs and outcrops) in the area of direct effects.

14 **10.4.12.2 Impacts**

16 Overall impact magnitude categories were based on professional judgment and include
17 (1) *small*: a relatively small proportion ($\leq 1\%$) of the special status species' habitat within the
18 SEZ region would be lost; (2) *moderate*: an intermediate proportion (>1 but $\leq 10\%$) of the special
19 status species' habitat would be lost; and (3) *large*: $>10\%$ of the special status species' habitat
20 would be lost.

22 As presented in the Draft Solar PEIS, solar energy development within the Los Mogotes
23 East SEZ could affect potentially suitable habitats of special status species. The analysis
24 presented in the Draft Solar PEIS for the original Los Mogotes East SEZ developable area
25 indicated that development would result in no impact or a small overall impact on all special
26 status species (Table 10.4.12.1-1 in the Draft Solar PEIS). Development within the revised
27 Los Mogotes East SEZ could still affect the same 51 species evaluated in the Draft Solar PEIS;
28 however, the reduction in the developable area would result in reduced (and still small) impact
29 levels compared to original estimates in the Draft Solar PEIS.

31 Impacts on the Mexican spotted owl, western yellow-billed cuckoo, and fringed myotis,
32 special status species identified since publication of the Draft Solar PEIS to potentially occur
33 within the affected area of the Los Mogotes East SEZ, are discussed below and in
34 Table 10.4.12.1-1. The impact assessment for these additional species was carried out in the
35 same way as those species analyzed in the Draft Solar PEIS (Section 10.4.12.2 of the Draft
36 Solar PEIS).

39 **Mexican Spotted Owl.** The Mexican spotted owl is known to occur in Conejos County,
40 Colorado, and according to the SWReGAP habitat suitability model for the spotted owl,
41 suitable habitat for the species does not occur anywhere within the Los Mogotes East SEZ.
42 However, approximately 14 acres (<0.1 km²) of potentially suitable year-round habitat in the
43 assumed access road corridor could be directly affected by construction and operations
44 (Table 10.4.12.1-1). This direct effects area represents less than 0.1% of available suitable
45 habitat in the SEZ region. About 3,000 acres (12 km²) of potentially suitable year-round habitat
46 occurs within the area of indirect effects (Figure 10.4.12.1-1). The amount of potentially suitable

1 habitat within the indirect effects area represents about 0.4% of the available suitable habitat in
2 the SEZ region (Table 10.4.12.1-1).

3
4 The overall impact on the Mexican spotted owl from construction, operation, and
5 decommissioning of utility-scale solar energy facilities within the Los Mogotes East SEZ is
6 considered small, because the amount of potentially suitable foraging and nesting habitat for this
7 species in the area of direct effects represents less than 1% of potentially suitable habitat in the
8 SEZ region. The implementation of programmatic design features is expected to be sufficient to
9 reduce indirect impacts on this species to negligible levels.

10
11
12 **Western Yellow-Billed Cuckoo.** The western yellow-billed cuckoo is known to occur in
13 Conejos County, Colorado, and potentially suitable habitat occurs in the affected area of the Los
14 Mogotes East SEZ. According to the SWReGAP habitat suitability model, suitable habitat for
15 this species does not occur on the SEZ. However, the SWReGAP habitat suitability model
16 indicates approximately 215 acres (1 km²) of potentially suitable habitat in the area of indirect
17 effects, primarily along the Conejos River (Figure 10.4.12.1-1). This indirect effects area
18 represents about 8.6% of the available suitable habitat in the region (Table 10.4.12.1-1).

19
20 The overall impact on the western yellow-billed cuckoo from construction, operation, and
21 decommissioning of utility-scale solar energy facilities within the Los Mogotes East SEZ is
22 considered small, because no potentially suitable habitat for this species occurs in the area of
23 direct effects, and only indirect effects are possible. The implementation of design features is
24 expected to be sufficient to reduce indirect impacts to negligible levels.

25
26
27 **Fringed Myotis.** The fringed myotis is a year-round resident in southwestern Colorado
28 and is known to occur within the San Luis Valley. Although this species is not known to occur
29 in the proposed Los Mogotes East SEZ, field surveys conducted in 2011 documented the
30 presence of this species in the De Tilla Gulch SEZ (Rodriguez 2011). According to the
31 SWReGAP habitat suitability model, approximately 2,650 acres (11 km²) of suitable foraging
32 habitat in the revised Los Mogotes East SEZ may be directly affected by construction and
33 operations (Table 10.4.12.1-1). This direct effects area represents less than 0.1% of potentially
34 suitable habitat in the SEZ region. About 86,500 acres (350 km²) of potentially suitable habitat
35 occurs in the area of indirect effects; this area represents about 2.5% of the available suitable
36 habitat in the region (Table 10.4.12.1-1). Most of the potentially suitable habitat in the affected
37 area is foraging habitat represented by desert shrubland. There is no potentially suitable roosting
38 habitat (rocky cliffs and outcrops) in the area of direct effects; however, it is possible for
39 individuals to roost in nearby habitats within the area of indirect effects (Rodriguez 2011).

40
41 The overall impact on the fringed myotis from construction, operation, and
42 decommissioning of utility-scale solar energy facilities within the revised Los Mogotes East SEZ
43 is considered small, because the amount of potentially suitable foraging habitat for this species in
44 the area of direct effects represents less than 1% of potentially suitable foraging habitat in the
45 SEZ region. The implementation of design features is expected to be sufficient to reduce indirect
46 impacts on this species to negligible levels. Avoidance of all potentially suitable foraging

1 habitats is not feasible, because potentially suitable habitat is widespread throughout the area of
2 direct effects and readily available in other portions of the SEZ region.

3 4 5 **10.4.12.3 SEZ-Specific Design Features and Design Feature Effectiveness** 6

7 Required programmatic design features are described in Appendix A of this Final Solar
8 PEIS. SEZ-specific conditions will be considered when programmatic design features are
9 applied, for example:

- 10
11 • Pre-disturbance surveys shall be conducted within the SEZ to determine the
12 presence and abundance of special status species including those identified
13 in Table 10.4.12.1-1 of the Draft Solar PEIS, as well as those identified in
14 Table 10.4.12.1-1 of this Final Solar PEIS. Disturbance of occupied habitats
15 for these species shall be avoided or minimized to the extent practicable. If
16 avoiding or minimizing impacts on occupied habitats is not possible,
17 translocation of individuals from areas of direct effects or compensatory
18 mitigation of direct effects on occupied habitats may be used to reduce
19 impacts. A comprehensive mitigation strategy for special status species that
20 uses one or more of these options to offset the impacts of projects shall be
21 developed in coordination with the appropriate federal and state agencies.
22
- 23 • Avoidance or minimization of disturbance to wetland and riparian habitats
24 within the SEZ shall be employed to reduce impacts on halfmoon milkvetch
25 (*Astragalus allochrous* var. *playanus*), least moonwort (*Botrychium simplex*),
26 Rocky Mountain blazing-star (*Liatris ligulistylis*), Rio Grande chub (*Gila*
27 *pandora*), Rio Grande sucker (*Catostomus plebius*), milk snake (*Lampropeltis*
28 *triangulum*), bald eagle (*Haliaeetus leucocephalus*), Barrow's goldeneye
29 (*Bucephala islandica*), ferruginous hawk (*Buteo regalis*), and southwestern
30 willow flycatcher (*Empidonax traillii extimus*).
31
- 32 • Avoiding or limiting groundwater withdrawals for solar energy development
33 on the SEZ shall be employed to reduce impacts on groundwater-dependent
34 special status species, including those species that may occur in riparian or
35 aquatic habitats supported by groundwater. These species include the
36 southwestern willow flycatcher and the western yellow-billed cuckoo.
37
- 38 • Consultations with the USFWS and CDOW shall be conducted to address the
39 potential for impacts on the Mexican spotted owl and southwestern willow
40 flycatcher, which are species listed under the ESA. Consultation would
41 identify an appropriate survey protocol, avoidance measures, and, if
42 appropriate, reasonable and prudent alternatives, reasonable and prudent
43 measures, and terms and conditions for incidental take statements.
44
- 45 • Coordination with the USFWS and CDOW should be conducted to address
46 the potential for impacts on the Gunnison's prairie dog (*Cynomys gunnisoni*)

1 and northern leopard frog (*Rana pipiens*)—species that are either candidates
2 or under review for listing under the ESA. Coordination would identify an
3 appropriate survey protocol, avoidance measures, and, potentially,
4 translocation or compensatory mitigation.
5

6 If the programmatic design features are implemented, it is anticipated that the majority of
7 impacts on the special status species from habitat disturbance and groundwater use would be
8 reduced.
9

10 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
11 analyses due to changes to the SEZ boundaries, and consideration of comments received as
12 applicable, no SEZ-specific design features for special status species have been identified. Some
13 SEZ-specific design features may be identified through the process of preparing parcels for
14 competitive offer and subsequent project-specific analysis.
15

16 **10.4.13 Air Quality and Climate**

17 **10.4.13.1 Affected Environment**

18
19
20 Except as noted below, the information for air quality and climate presented in the
21 affected environment section of the Draft Solar PEIS remains essentially unchanged.
22
23
24
25

26 ***10.4.13.1.1 Existing Air Emissions***

27
28 The Draft Solar PEIS presented Conejos County emissions data for 2002. More recent
29 data for 2008 (CDPHE 2011) were reviewed. The two emissions inventories are from different
30 sources and assumptions. All emissions in the 2008 data were lower than those in the 2002 data;
31 all criteria air pollutants were much lower, but VOCs were about half of those in the 2002 data.
32 These changes would not affect modeled air quality impacts presented in this update.
33
34

35 ***10.4.13.1.2 Air Quality***

36
37 The calendar quarterly average NAAQS of 1.5 µg/m³ for lead (Pb) presented in
38 Table 10.4.13.1-2 of the Draft Solar PEIS has been replaced by the rolling 3-month standard
39 (0.15 µg/m³). The federal 24-hour and annual SO₂, 1-hour O₃, and annual PM₁₀ standards have
40 been revoked as well (EPA 2011). All Colorado SAAQS, except the 3-hour SO₂ standard of
41 700 µg/m³, have been revoked since the Draft Solar PEIS. These changes will not affect the
42 modeled air quality impacts presented in this update.
43

44 The size of the proposed Los Mogotes East SEZ was reduced by about 55%, from
45 5,918 acres (23.9 km²) to 2,650 acres (10.7 km²) by removing the western half of the originally
46 proposed SEZ. Based on this reduction, the distances from the proposed SEZ to the Great Sand

1 Dunes WA and Wheeler Peak WA in New Mexico did not change, and the distances to
2 Weminuche WA and La Garita WA increased by about 1 mi (1.6 km).

3 4 5 **10.4.13.2 Impacts**

6 7 8 **10.4.13.2.1 Construction**

9 10 11 **Methods and Assumptions**

12
13 Except for the area disturbed at any one time during construction, the methods and
14 modeling assumptions have not changed from those presented in the Draft Solar PEIS. Based on
15 the reduction in the area of the proposed Los Mogotes East SEZ, air quality for this Final Solar
16 PEIS was remodeled by assuming that 2,120 acres (8.6 km²), 80% of the updated developable
17 area, would be disturbed at any one time. The Draft Solar PEIS assumed disturbance of an area
18 of 3,000 acres (12.1 km²).

19 20 21 **Results**

22
23 Since the annual PM₁₀ standard has been rescinded, the discussion of annual PM₁₀
24 impacts in the Draft Solar PEIS is no longer applicable, and Table 10.4.13.2-1 has been updated
25 for this Final Solar PEIS. The concentration values in the table are based on updated air quality
26 modeling reflecting the updated boundaries of the proposed SEZ.

27
28 With the reduced area of the proposed SEZ, the concentrations predicted for this Final
29 Solar PEIS are less than those predicted in the Draft Solar PEIS, but the conclusions presented in
30 the Draft Solar PEIS remain valid.¹ Predicted 24-hour PM₁₀ and 24-hour PM_{2.5} concentration
31 levels could exceed NAAQS levels used for comparison at the SEZ boundaries and in the
32 immediately surrounding area during the construction phase of a solar development. These high
33 particulate levels would be limited to the immediate area surrounding the SEZ boundaries and
34 would decrease quickly with distance. Predicted total concentrations for annual PM_{2.5} would be
35 below the standard level used for comparison.

36
37 The updated analysis conducted for this Final Solar PEIS predicted lower concentrations
38 at all modeled locations than those in the Draft Solar PEIS. For 24-hr PM₁₀, the concentration at

¹ At this programmatic level, detailed information on construction activities, such as facility size, type of solar technology, heavy equipment fleet, activity level, work schedule, and so on, is not known; thus air quality modeling cannot be conducted. It has been assumed that 80% of the developable area of 2,650 acres (10.7 km²) would be disturbed continuously; thus the modeling results and discussion here should be interpreted in that context. During the site-specific project phase, more detailed information would be available and more realistic air quality modeling analysis could be conducted. It is likely that impacts on ambient air quality predicted for specific projects would be much lower than those in this Final Solar PEIS.

1 **TABLE 10.4.13.2-1 Maximum Air Quality Impacts from Emissions Associated with**
 2 **Construction Activities for the Proposed Los Mogotes East SEZ as Revised**

Pollutant ^a	Averaging Time	Rank ^b	Concentration ($\mu\text{g}/\text{m}^3$)				Percentage of NAAQS	
			Maximum Increment ^b	Background	Total	NAAQS	Increment	Total
PM ₁₀	24 hours	H6H	374	27	401	150	249	267
PM _{2.5}	24 hours	H8H	26.0	16	42.0	35	74	120
	Annual	- ^c	6.3	4	10.3	15	42	68

a PM_{2.5} = particulate matter with a diameter of $\leq 2.5 \mu\text{m}$; PM₁₀ = particulate matter with a diameter of $\leq 10 \mu\text{m}$.

b Concentrations for attainment demonstration are presented. H6H = highest of the sixth-highest concentrations at each receptor over the 5-year period. H8H = highest of the multiyear average of the eighth-highest concentrations at each receptor over the 5-year period. For the annual average, multiyear averages of annual means over the 5-year period are presented. Maximum concentrations are predicted to occur at the site boundaries.

c A dash indicates not applicable.

Source: Chick (2009) for background concentration data.

3
 4
 5 the nearest residence about 0.4 mi (0.6 km) east of the SEZ changed from above to below the
 6 standard level used for comparison. The updated concentration at the second nearest residence
 7 about 0.6 mi (1.0 km) north of the SEZ was above the standard level used for comparison.
 8 However, construction activities are not subject to the PSD program; the comparison is made as
 9 an indicator of possible dust levels at the residence during the limited construction period and as
 10 a screen to gage the size of the potential impact. Therefore, it is anticipated that the potential
 11 impacts of construction activities on ambient air quality would be moderate and temporary.

12
 13 Other locations modeled include the communities of Antonito, Conejos, Romeo, La Jara,
 14 Manassa, Estrella, Sanford, and San Antonio. At these communities, the conclusions of the Draft
 15 Solar PEIS that total predicted concentrations would be below the standard level used for
 16 comparison remain valid.

17
 18 With the reduced area of the proposed SEZ, updated 24-hour and annual PM₁₀
 19 concentration increments the nearest Class I area, Great Sand Dunes WA, would be lower than
 20 those in the Draft Solar PEIS, about 6.9 and 0.14 $\mu\text{g}/\text{m}^3$, or 87% and 4%, respectively, of the
 21 allowable PSD increment levels for Class I areas. The conclusion in the Draft Solar PEIS that
 22 24-hr PM₁₀ PSD Class I increments could be exceeded in the Great Sand Dunes WA is updated
 23 for this Final Solar PEIS to conclude that all Class I PSD increments for PM₁₀ would be met at
 24 the nearest Class I area. The conclusion of the Draft Solar PEIS that concentration increments at
 25 the other three Class I areas (La Garita WA and Weminuche WA in Colorado, and Wheeler Peak

1 WA in New Mexico) would be much lower than those at the Great Sand Dunes WA and thus
2 would not be exceeded remains valid.

3
4 With the reduced size of the Los Mogotes East SEZ, emissions from construction
5 equipment and vehicles would be less than those discussed in the Draft Solar PEIS. Any
6 potential impacts on AQRVs at nearby federal Class I areas would be less. The conclusions in
7 the Draft Solar PEIS remain valid. Emissions from construction-related equipment and vehicles
8 are temporary in nature and could cause some unavoidable but short-term impacts.
9

10 11 ***10.4.13.2.2 Operations*** 12

13 The reduction in the size of the proposed Los Mogotes East SEZ by about 55% from
14 5,918 acres (23.9 km²) to 2,650 acres (10.7 km²) reduces the generating capacity and annual
15 power generation and thus reduces the potentially avoided emissions presented in the Draft Solar
16 PEIS. Total revised power generation capacity ranging from 236 to 424 MW is estimated for the
17 Los Mogotes East SEZ for various solar technologies. As explained in the Draft Solar PEIS, the
18 estimated amount of emissions avoided for the solar technologies evaluated depends only on
19 the megawatts of conventional fossil fuel-generated power avoided. Updated estimates for
20 emissions potentially avoided by a solar facility can be obtained from the table in the Draft
21 Solar PEIS by reducing the tabulated estimates by about 55%, as shown in the revised
22 Table 10.4.13.2-2. For example, for the technologies estimated to require 9 acres/MW (power
23 tower, dish engine, and PV), up to 629 tons per year (= 44.78% × [the low-end value of
24 1,405 tons per year tabulated in the Draft Solar PEIS]) of NO_x could be avoided by full solar
25 development of the proposed Los Mogotes East SEZ as revised for this Final Solar PEIS.
26 Although the total emissions avoided by full solar development of the proposed SEZ are
27 considerably reduced from those presented in the Draft Solar PEIS, the conclusions of the Draft
28 remain valid. Solar facilities built in the Los Mogotes East SEZ could avoid relatively more
29 fossil fuel emissions than those built in other states that rely less on fossil fuel-generated power.
30

31 32 ***10.4.13.2.3 Decommissioning and Reclamation*** 33

34 The discussion in the Draft Solar PEIS remains valid. Decommissioning and reclamation
35 activities would be of short duration, and their potential air impacts would be moderate and
36 temporary.
37

38 39 **10.4.13.3 SEZ-Specific Design Features and Design Feature Effectiveness** 40

41 Required programmatic design features that would reduce air quality impacts are
42 described in Section A.2.2 of Appendix A of this Final Solar PEIS. Limiting dust generation
43 during construction and operations is a required programmatic design feature under the BLM
44 Solar Energy Program. These extensive fugitive dust control measures would keep off-site
45 PM levels as low as possible during construction.
46

1 **TABLE 10.4.13.2-2 Annual Emissions from Combustion-Related Power Generation Avoided by**
 2 **Full Solar Development of the Proposed Los Mogotes East SEZ as Revised**

Area Size (acres) ^a	Capacity (MW) ^b	Power Generation (GWh/yr) ^c	Emissions Avoided (tons/yr; 10 ³ tons/yr for CO ₂) ^d			
			SO ₂	NO _x	Hg	CO ₂
2,650	236–424	413–743	546–982	629–1,133	0.004–0.006	408–734
Percentage of total emissions from electric power systems in the state of Colorado ^e			0.87–1.6%	0.87–1.6%	0.87–1.6%	0.87–1.6%
Percentage of total emissions from all source categories in the state of Colorado ^f			0.46–0.83%	0.15–0.28%	– ^g	0.39–0.71%
Percentage of total emissions from electric power systems in the six-state study area ^e			0.22–0.39%	0.17–0.31%	0.12–0.22%	0.16–0.28%
Percentage of total emissions from all source categories in the six-state study area ^f			0.12–0.21%	0.02–0.04%	–	0.05–0.09%

- a To convert acres to km², multiply by 0.004047.
- b It is assumed that the SEZ would eventually have development on 80% of the lands and that a range of 5 acres (0.020 km²) per MW (for parabolic trough technology) to 9 acres (0.036 km²) per MW (power tower, dish engine, and photovoltaic technologies) would be required.
- c Assumed a capacity factor of 20%.
- d Composite combustion-related emission factors for SO₂, NO_x, Hg, and CO₂ of 2.64, 3.05, 1.71 × 10⁻⁵, and 1,976 lb/MWh, respectively, were used for the state of Colorado.
- e Emission data for all air pollutants are for 2005.
- f Emission data for SO₂ and NO_x are for 2002, while those for CO₂ are for 2005.
- g A dash indicates not estimated.

5
6
7
8
9
10
11
12

On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those analyses due to changes to the SEZ boundaries, and consideration of comments received as applicable, no SEZ-specific design features for air quality have been identified. Some SEZ-specific design features may be identified through the process of preparing parcels for competitive offer and subsequent project-specific analysis.

1 **10.4.14 Visual Resources**

2
3
4 **10.4.14.1 Affected Environment**

5
6 The proposed Los Mogotes East SEZ, as revised, extends approximately 5.0 mi (8.0 km)
7 north to south and 1.0 mi (1.6 km) east to west. The SEZ has been revised to eliminate
8 3,268 acres (13.2 km²), primarily within the western half of the SEZ. The proposed Los Mogotes
9 East SEZ now occupies an area of 2,650 acres (10.7 km²). Because of the reduction in the size of
10 the SEZ, the total acreage of the lands visible within the 25-mi (40-km) viewshed of the SEZ has
11 decreased.

12
13 An updated visual resources inventory (VRI) map for the SEZ and surrounding lands is
14 shown in Figure 10.4.14.1-1; it provides information from the BLM's September 2010 VRI,
15 which was finalized in October 2011 (BLM 2011a). As shown, the VRI value for the SEZ still
16 is VRI Class III, indicating moderate relative visual values.

17
18 Lands in the La Jara Field Office within the 25-mi (40-km), 650-ft (198-m) viewshed
19 of the revised SEZ include 42,978 acres (173.9 km²) of VRI Class II areas; 50,825 acres
20 (205.7 km²) of VRI Class III areas; and 23,210 acres (93.9 km²) of VRI Class IV areas.

21
22
23 **10.4.14.2 Impacts**

24
25 The reduction in size of the SEZ would reduce the total visual impacts associated
26 with solar energy development in the SEZ. It would limit the total amount of solar facility
27 infrastructure that would be visible and would reduce the geographic extent of the visible
28 infrastructure.

29
30 The reduction in size of the SEZ eliminated approximately 55% of the original SEZ. The
31 resulting visual contrast reduction for any given point within view of the SEZ would vary greatly
32 depending on the viewpoint's distance and direction from the SEZ. Contrast reduction generally
33 would be greatest for viewpoints closest to the portions of the SEZ that were eliminated,
34 especially for those that had wide-angle views of these areas. In general, contrast reductions
35 also would be larger for elevated viewpoints relative to non-elevated viewpoints, because the
36 reduction in area of the solar facilities would be more apparent when looking down at the SEZ
37 than when looking across it.

38
39
40 ***10.4.14.2.1 Impacts on the Proposed Los Mogotes East SEZ***

41
42 Although the reduction in the size of the SEZ would reduce visual contrasts associated
43 with solar development, solar development within the SEZ still would involve major
44 modification of the existing character of the landscape and would likely dominate the views from
45 most locations within the SEZ. Additional impacts would occur as a result of the construction,
46 operation, and decommissioning of related facilities, such as access roads and electric

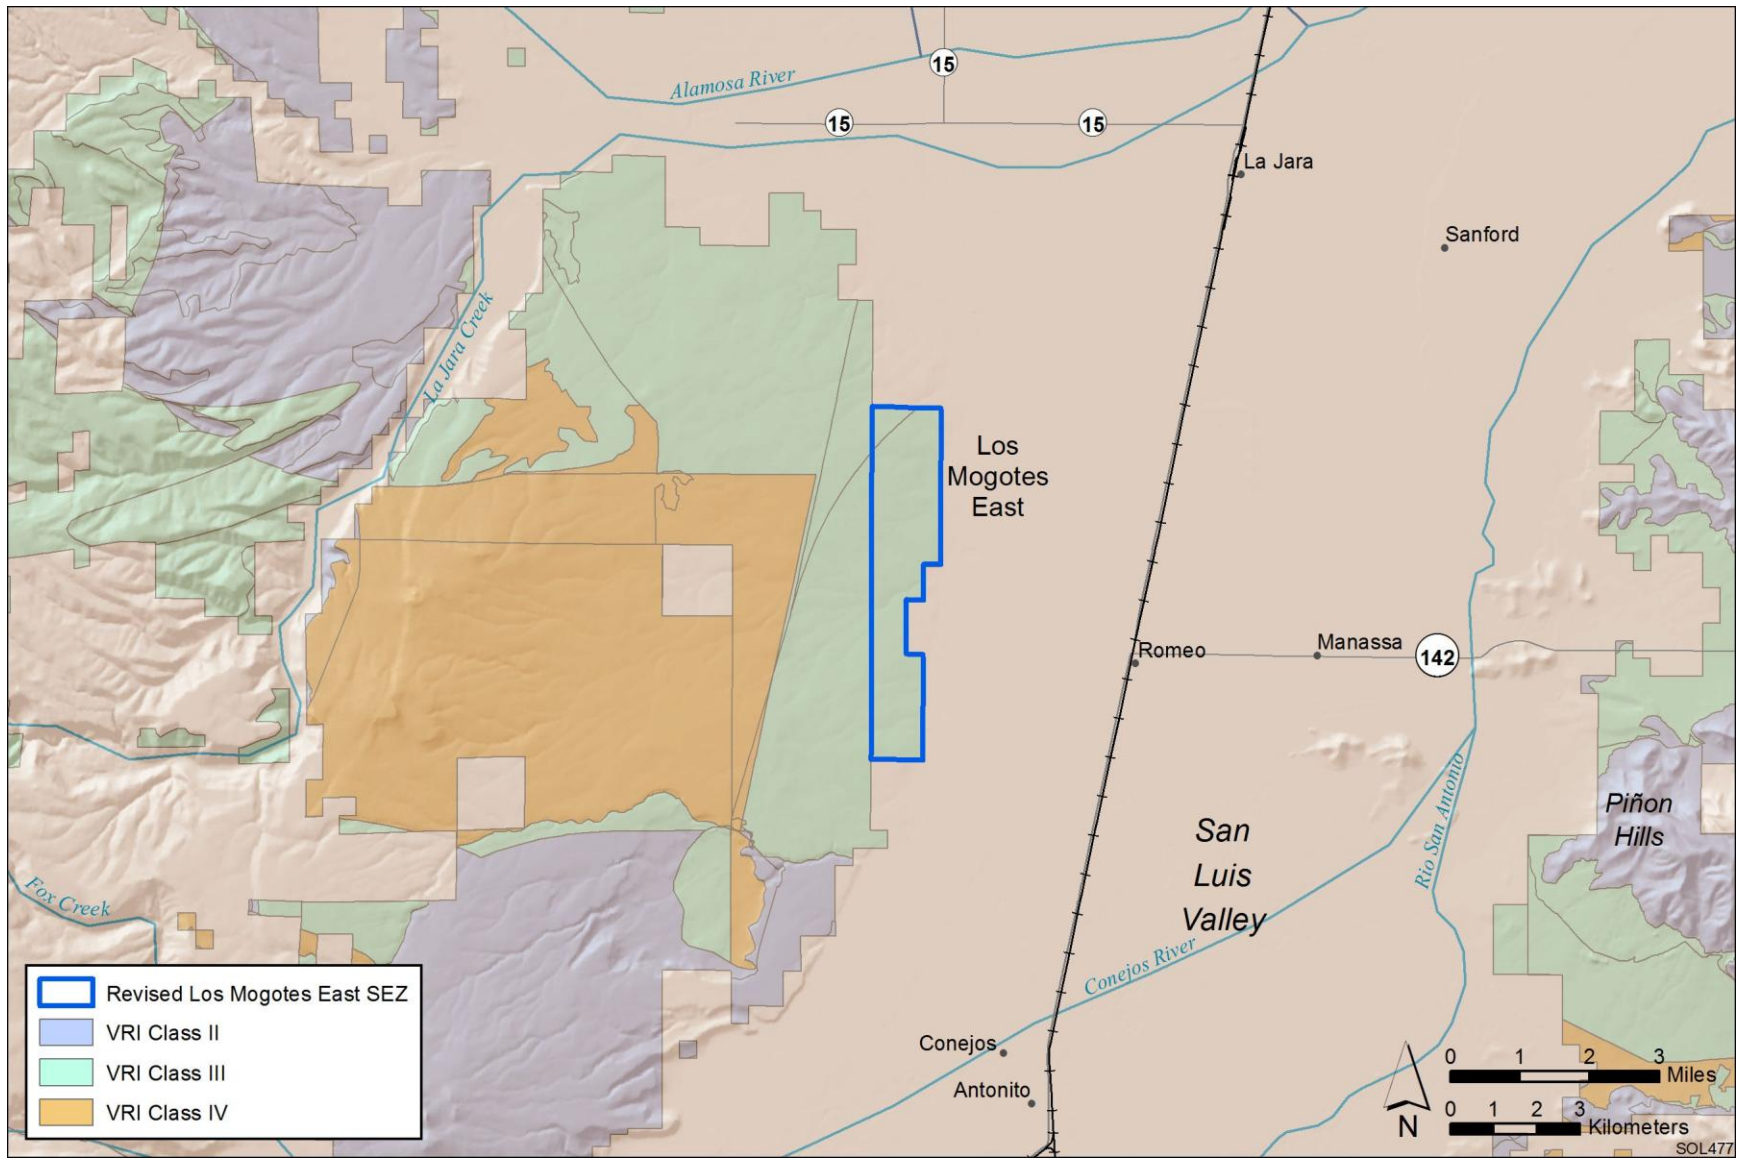

FIGURE 10.4.14.1-1 Visual Resource Inventory Values for the Proposed Los Mogotes East SEZ as Revised

1 transmission lines. In general, strong visual contrasts from solar development still would be
2 expected to be observed from viewing locations within the SEZ.
3
4

5 ***10.4.14.2.2 Impacts on Lands Surrounding the Proposed Los Mogotes East SEZ*** 6

7 For the Draft Solar PEIS, preliminary viewshed analyses were conducted to identify
8 which lands surrounding the proposed SEZ could have views of solar facilities in at least some
9 portion of the SEZ (see Appendixes M and N of the Draft Solar PEIS for important information
10 on assumptions and limitations of the methods used). Four viewshed analyses were conducted,
11 assuming four different heights representative of project elements associated with potential solar
12 energy technologies: PV and parabolic trough arrays, 24.6 ft (7.5 m); solar dishes and power
13 blocks for CSP technologies, 38 ft (11.6 m); transmission towers and short solar power towers,
14 150 ft (45.7 m); and tall solar power towers, 650 ft (198.1 m).
15

16 These same viewsheds were recalculated in order to account for the boundary changes
17 described in the Supplement to the Draft Solar PEIS. Figure 10.4.14.2-1 shows the combined
18 results of the viewshed analyses for all four solar technologies. The colored portions indicate
19 areas with clear lines of sight to one or more areas within the SEZ and from which solar facilities
20 within these areas of the SEZ would be expected to be visible, assuming the absence of screening
21 vegetation or structures and adequate lighting and other atmospheric conditions. The light brown
22 areas are locations from which PV and parabolic trough arrays located in the SEZ could be
23 visible. Solar dishes and power blocks for CSP technologies would be visible from the areas
24 shaded light brown and the additional areas shaded light purple. Transmission towers and short
25 solar power towers would be visible from the areas shaded light brown, light purple, and the
26 additional areas shaded dark purple. Power tower facilities located in the SEZ could be visible
27 from areas shaded light brown, light purple, dark purple, and at least the upper portions of power
28 tower receivers could be visible from the additional areas shaded medium brown.
29
30

31 ***10.4.14.2.3 Impacts on Selected Federal-, State-, and BLM-Designated Sensitive*** 32 ***Visual Resource Areas and Other Lands and Resources*** 33

34 Figure 10.4.14.2-2 shows the results of a GIS analysis that overlays selected federal-,
35 state-, and BLM-designated sensitive visual resource areas onto the combined tall solar power
36 tower (650 ft [198.1 m]) and PV and parabolic trough array (24.6 ft [7.5 m]) viewsheds, in order
37 to illustrate which of these sensitive visual resource areas could have views of solar facilities
38 within the SEZ and therefore potentially would be subject to visual impacts from those facilities.
39 Distance zones that correspond with BLM's VRM system-specified foreground-middleground
40 distance (5 mi [8 km]), background distance (15 mi [24 km]), and a 25-mi (40-km) distance
41 zone are shown as well, in order to indicate the effect of distance from the SEZ on impact
42 levels, which are highly dependent on distance. A similar analysis was conducted for the Draft
43 Solar PEIS.
44
45

1

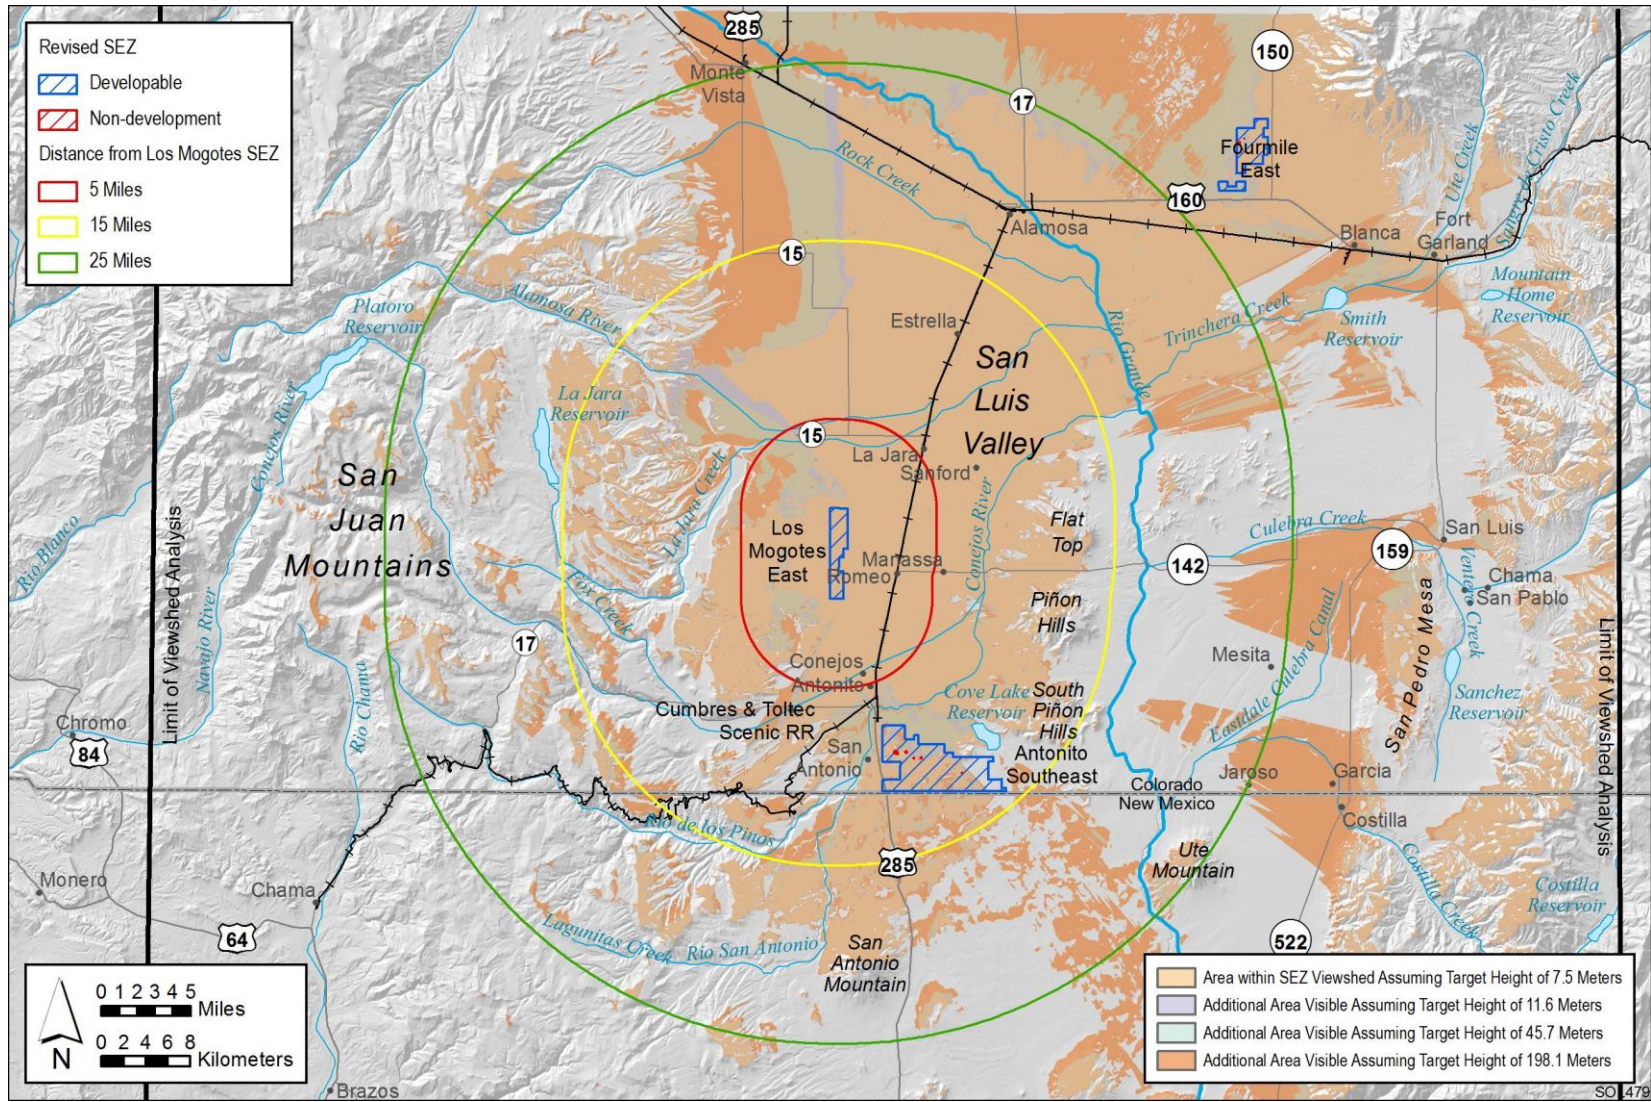

FIGURE 10.4.14.2-1 Viewshed Analyses for the Proposed Los Mogotes East SEZ as Revised and Surrounding Lands, Assuming Viewshed Heights of 24.6 ft (7.5 m), 38 ft (11.6 m), 150 ft (45.7 m), and 650 ft (198.1 m) (shaded areas indicate lands from which solar development and/or associated structures within the SEZ could be visible)

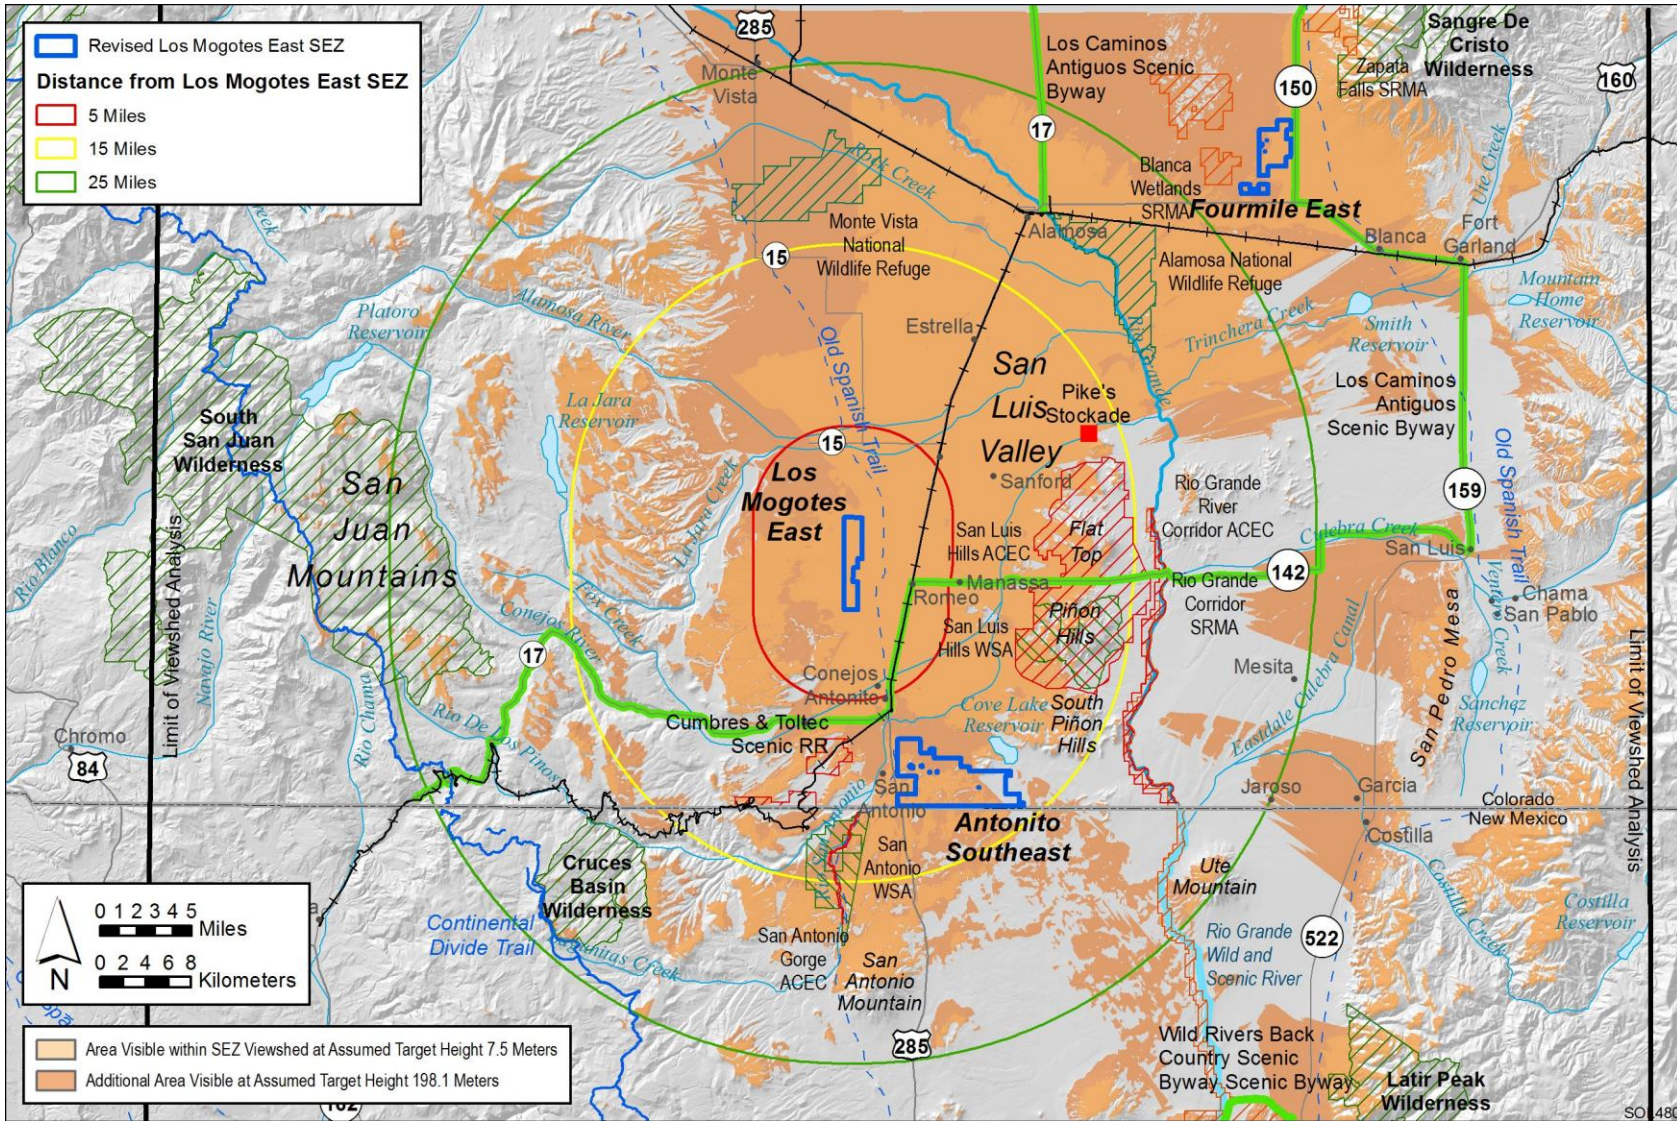

FIGURE 10.4.14.2-2 Overlay of Selected Sensitive Visual Resource Areas onto Combined 650-ft (198.1-m) and 24.6-ft (7.5-m) Viewsheds for the Proposed Los Mogotes East SEZ as Revised

1 The scenic resources included in the viewshed analyses were as follows:
2

- 3 • National Parks, National Monuments, National Recreation Areas, National
4 Preserves, National Wildlife Refuges, National Reserves, National
5 Conservation Areas, National Historic Sites;
6
- 7 • Congressionally authorized Wilderness Areas;
8
- 9 • Wilderness Study Areas;
10
- 11 • National Wild and Scenic Rivers;
12
- 13 • Congressionally authorized Wild and Scenic Study Rivers;
14
- 15 • National Scenic Trails and National Historic Trails;
16
- 17 • National Historic Landmarks and National Natural Landmarks;
18
- 19 • All-American Roads, National Scenic Byways, State Scenic Highways, and
20 BLM- and USFS-designated scenic highways/byways;
21
- 22 • BLM-designated Special Recreation Management Areas; and
23
- 24 • ACECs designated because of outstanding scenic qualities.
25

26 The results of the GIS analyses are summarized in Table 10.4.14.2-1. The change in size
27 of the SEZ alters the viewshed, such that the visibility of the SEZ and solar facilities within the
28 SEZ from the surrounding lands would be reduced. With the reduction in size of the SEZ, solar
29 energy development within the SEZ would be expected to create minimal or weak visual
30 contrasts for viewers within most of the surrounding scenic resource areas and other resources
31 listed in Table 10.4.14.2-1. Exceptions include the San Luis Hills WSA and ACEC and the
32 Los Antiguos Caminos Scenic Byway. In these three areas, moderate or strong visual contrasts
33 still could occur.
34

35 In addition to these areas, impacts on other lands and resource areas also were evaluated.
36 These areas include the surrounding communities of Antonito, Conejos, La Jara, Manassa,
37 Romeo, and Sanford; the CTSR; and the West Fork of the North Branch of the Old Spanish
38 Trail.
39

40 41 ***10.4.14.2.4 Summary of Visual Resource Impacts for the Proposed Los Mogotes*** 42 ***East SEZ*** 43

44 The visual contrast analysis in the Draft Solar PEIS determined that because there could
45 be multiple solar facilities within the Los Mogotes East SEZ, a variety of technologies employed,
46 and a range of supporting facilities required, solar development within the SEZ would make it

1 **TABLE 10.4.14.2-1 Selected Potentially Affected Sensitive Visual Resources within a 25-mi**

^e Source: America's Byways (2011).

1 essentially industrial in appearance and would contrast strongly with the surrounding mostly
2 natural-appearing landscape.

3
4 The reduction in size of the SEZ would reduce the visual contrast associated with solar
5 facilities as seen both within the SEZ and from surrounding lands in both daytime and nighttime
6 views. The reductions in visual contrast can be summarized as follows:

- 7
8 • Within the Los Mogotes East SEZ: Contrasts experienced by viewers within
9 the western portion of the SEZ would be reduced because of the elimination
10 of more than half the total area of the SEZ, as it was originally proposed in the
11 Draft Solar PEIS. However, strong contrasts still could be observed in the
12 remaining developable area.
- 13
14 • Cruces Basin WA: A slight reduction in contrasts would be anticipated
15 because of the elimination of acreage in the western half of the SEZ; solar
16 development within the SEZ still would cause minimal to weak contrasts.
- 17
18 • South San Juan WA: A slight reduction in contrasts would be anticipated;
19 solar development within the SEZ still would cause minimal to weak
20 contrasts.
- 21
22 • San Antonio WSA: A slight reduction in contrasts would be anticipated; solar
23 development within the SEZ still would cause minimal to weak contrasts,
24 depending on viewer location in the WSA.
- 25
26 • San Luis Hills WSA: A reduction in contrasts would be anticipated; solar
27 development within the SEZ still would cause weak to moderate contrasts,
28 depending on viewer location in the WSA.
- 29
30 • Continental Divide National Scenic Trail: A slight reduction in contrasts
31 would be anticipated due to the elimination of acreage in the western half of
32 the SEZ; solar development within the SEZ still would cause minimal to weak
33 contrasts, depending on viewer location on the trail.
- 34
35 • Pike's Stockade National Historic Landmark: A slight reduction in contrasts
36 would be anticipated; solar development within the SEZ still would cause
37 minimal to weak contrasts.
- 38
39 • Alamosa NWR: A very slight reduction in contrasts would be anticipated;
40 solar development within the SEZ still would cause minimal contrasts.
- 41
42 • Monte Vista NWR: A very slight reduction in contrasts would be anticipated;
43 solar development within the SEZ still would cause minimal contrasts.
- 44
45 • San Luis Hills ACEC: A reduction in contrasts would be anticipated; solar
46 development within the SEZ still would cause weak to moderate contrasts.

45

- CTSR Corridor ACEC: A reduction in contrasts would be anticipated; solar development within the SEZ still would cause weak contrasts.
- San Antonio Gorge ACEC: No impacts are anticipated since the creek and ACEC are within a canyon.
- Los Caminos Antiguos Scenic Byway: A very slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause weak to strong contrasts, depending on viewer location on the byway.
- Antonito: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause weak contrasts.
- Conejos: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause weak contrasts.
- La Jara: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause moderate contrasts.
- Manassa: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause strong contrasts.
- Romeo: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause strong contrasts.
- Sanford: A slight reduction in contrasts would be anticipated; solar development within the SEZ still would cause moderate to strong contrasts.
- CTSR: A reduction in contrasts would be anticipated; solar development within the SEZ still would cause weak contrasts.
- West Fork of the North Branch of the Old Spanish Trail: A reduction in contrasts would be anticipated because of the elimination of acreage in the western half of the SEZ; however, solar development within the SEZ still would cause minimal to strong contrasts depending on observer location on the Trail.

In addition, the proposed Antonito Southeast SEZ is relatively close to the proposed Los Mogotes East SEZ (approximately 7 mi [11.3 km]). A majority of the Antonito Southeast SEZ is located within the 25-mi (40-km) viewshed of the Los Mogotes East SEZ, and some of the sensitive visual resource areas discussed above may be subject to impacts associated with both SEZs.

10.4.14.3 SEZ-Specific Design Features and Design Feature Effectiveness

Required programmatic design features that would reduce impacts on visual resources are described in Section A.2.2 of Appendix A of this Final Solar PEIS. While application of the programmatic design features would reduce potential visual impacts somewhat, the degree of effectiveness of these design features could be assessed only at the site- and project-specific level. With the large scale, reflective surfaces, and strong regular geometry of utility-scale solar energy facilities and the lack of screening vegetation and landforms within the SEZ viewshed, siting the facilities away from sensitive visual resource areas and other sensitive viewing areas would be the primary means of mitigating visual impacts. The effectiveness of other visual impact mitigation measures generally would be limited. Utility-scale solar energy development using any of the solar technologies analyzed in the PEIS and at the scale analyzed would be expected to result in large adverse visual impacts that could not be mitigated.

On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those analyses due to changes to the SEZ boundaries, and consideration of comments received as applicable, the following proposed SEZ-specific design feature for the SEZ has been identified:

- The development of power tower facilities should be prohibited within the SEZ. The San Luis Valley is a regionally important tourist destination and is an area with many small communities and numerous important historic, cultural, and recreational resources. The valley contains numerous historic sites, two scenic railways, two scenic highways, several wildlife refuges, Great Sand Dunes NP and Preserve, the Rio Grande WSR, congressionally designated WAs, the Sangre de Cristo NHA, and various other attractions that draw tourists to the region. A number of these areas overlook the San Luis Valley from the surrounding mountains and include elevated viewpoints that would have clear views of power tower facilities in the Valley. The height of solar power tower receiver structures, combined with the intense light generated by the receivers atop the towers, would be expected to create strong visual contrasts that could not be effectively screened from view for most areas surrounding the SEZ. The effective area of impact from power tower structures is much larger than that for comparably rated lower height facilities, which makes it more likely that they would conflict with the growing tourism focus of the Valley. In addition, for power towers exceeding 200 ft (61 m) in height, hazard navigation lighting that could be visible for very long distances would likely be required. Prohibiting the development of power tower facilities would remove this source of impacts, thus substantially reducing potential visual impacts on the West Fork of the North Branch of the Old Spanish Trail; the Los Caminos Antiguos Scenic Byway; the other sensitive visual resource areas identified above; and the communities of Antonito, Conejos, La Jara, Manassa, Romeo, and Sanford.

The need for additional SEZ-specific design features will be identified through the process of preparing parcels for competitive offer and subsequent project-specific analysis.

1 **10.4.15 Acoustic Environment**

2
3
4 **10.4.15.1 Affected Environment**

5
6 The size of the proposed Los Mogotes East SEZ was reduced by about 55%, from
7 5,918 acres (23.9 km²) to 2,650 acres (10.7 km²) by removing the western half of the originally
8 proposed SEZ. Distances to the nearest residences and towns, which are all located north, east,
9 or south of the SEZ, remain the same as in the Draft Solar PEIS. The updated distance to the
10 Los Mogotes ACEC, located to the west, is about 2 mi (3.2 km), greater than the distance of
11 about 1 mi (1.6 km) in the Draft Solar PEIS.

12
13
14 **10.4.15.2 Impacts**

15
16 Based on the boundary changes and reduced size of the proposed Los Mogotes East SEZ,
17 noise impacts from construction and operations were remodeled for this Final Solar PEIS.
18 Distances from the SEZ to the nearest residences and towns have not changed, and except as
19 noted below for impacts on specially designated areas and impacts from operating dish engine
20 facilities, the conclusions of the Draft Solar PEIS remain valid.

21
22
23 **10.4.15.2.1 Construction**

24
25 Except as noted below for impacts in specially designated areas, the conclusions in the
26 Draft Solar PEIS remain valid.

27
28 On the basis of comments received and recent references as applicable, this Final Solar
29 PEIS used an updated approximate significance threshold of 55 dBA corresponding to the onset
30 of adverse physiological impacts (Barber et al. 2010) to update the analysis of potential noise
31 impacts on terrestrial wildlife in areas of special concern. As a result of this updated analysis, the
32 conclusion in the Draft Solar PEIS that wildlife would not be adversely affected has been
33 updated for this Final Solar PEIS as follows. With construction activities occurring near the
34 southwestern SEZ boundary, the estimated noise level at the boundary of the Los Mogotes
35 ACEC (about 2 mi [3 km] to the west) is about 34 dBA. This estimated level is below the
36 updated significance threshold, and thus noise from construction in the proposed Los Mogotes
37 East SEZ is not anticipated to adversely affect wildlife in the nearby specially designated areas.
38 However, as discussed in Section 5.10.2 of this Final Solar PEIS, there is the potential for other
39 effects (e.g., startle or masking) to occur at lower noise levels (Barber et al. 2011). With these
40 impacts and the potential for impacts at lower noise levels, impacts on terrestrial wildlife from
41 construction noise would have to be considered on a project-specific basis, including site-
42 specific background levels and hearing sensitivity for site-specific terrestrial wildlife of concern.
43 However, even considering potential impacts at these lower noise levels, construction noise at
44 the SEZ would not be anticipated to affect wildlife there.

1 For construction activities occurring near the eastern SEZ boundary, the estimated noise
2 level at the West Fork of the North Branch of the Old Spanish Trail (about 1.0 mi [1.6 km] to the
3 east) would be about 42 dBA, which is just above the typical daytime mean rural background
4 level of 40 dBA but less than a just noticeable difference of 3 dBA. The conclusion in the Draft
5 Solar PEIS that construction occurring near the eastern SEZ boundary would result in minor
6 noise impacts on the West Fork of the North Branch of the Old Spanish Trail is updated for this
7 Final Solar PEIS to conclude that the noise impacts would be negligible and temporary.
8

9 Overall, construction would cause some unavoidable but localized short-term impacts on
10 neighboring communities, particularly for activities occurring near the eastern proposed SEZ
11 boundary, close to the nearby residences. No adverse vibration impacts are anticipated from
12 construction activities, including pile driving for dish engines.
13

14 **10.4.15.2.2 Operations**

15 The conclusions presented in the Draft Solar PEIS remain valid, except as noted below
16 for impacts from TES and dish engine facilities near residences or in specially designated areas.
17

18 **Parabolic Trough and Power Tower**

19
20
21
22
23 If TES were not used for parabolic trough and power tower technologies (12 hours of
24 daytime operations only), estimated noise levels at the nearest residence about 0.4 mi (0.6 km)
25 from the SEZ boundary would be about 45 dBA, which exceeds the typical daytime mean rural
26 background of 40 dBA. The day-night average noise level of 44 dBA L_{dn} would be well below
27 the EPA guideline of 55 dBA L_{dn} for residential areas. If TES were used, the estimated nighttime
28 noise level at the nearest residence would be about 55 dBA, which is significantly higher than
29 the typical nighttime mean rural background level of 30 dBA. The day-night average noise level
30 is estimated to be about 57 dBA L_{dn} , which is a little higher than the EPA guideline of 55 dBA
31 L_{dn} for residential areas. The assumptions are conservative in terms of operating hours, and no
32 credit was given to other attenuation mechanisms. Thus, it is likely that noise levels would be
33 lower than 53 dBA L_{dn} at the nearest residence, even if TES were used at a solar facility.
34 Nonetheless, operating parabolic trough or power tower facilities with TES located near the
35 southeastern SEZ boundary could result in noise impacts on the nearest residence, depending
36 on background noise levels and meteorological conditions.
37

38 As stated above under construction impacts, for this Final Solar PEIS an updated
39 approximate significance threshold of 55 dBA was used to evaluate potential noise impacts on
40 terrestrial wildlife in areas of special concern. With TES operating near the western SEZ
41 boundary, estimated daytime and nighttime noise levels at the boundary of the Los Mogotes
42 ACEC (about 2 mi [3 km] to the west) would be about 36 and 46 dBA, respectively. These
43 estimated levels are below the significance threshold; thus, noise from operations in the proposed
44 Los Mogotes East SEZ is not anticipated to adversely affect wildlife in the nearby specially
45 designated area. However, as discussed in Section 5.10.2, there is the potential for other effects
46 (e.g., startle) to occur at lower noise levels (Barber et al. 2011). With these impacts and the

1 potential for impacts at lower noise levels, noise impacts on terrestrial wildlife from a parabolic
2 trough or power tower facility equipped with TES would have to be considered on a project-
3 specific basis, including site-specific background levels and hearing sensitivity for site-specific
4 terrestrial wildlife of concern.

5
6 Associated with operation of a parabolic trough or power tower facility equipped with
7 TES occurring at the eastern boundary of the SEZ, the estimated daytime and nighttime noise
8 levels at the West Fork of the North Branch of the Old Spanish Trail (about 1.0 mi [1.6 km] to
9 the east) would be about 41 and 51 dBA, respectively, which are comparable to and far above
10 the typical daytime and nighttime mean rural background levels of 40 and 30 dBA. Accordingly,
11 operation of a solar facility with TES located near the eastern SEZ boundary could result in noise
12 impacts on the West Fork of the North Branch of the Old Spanish Trail during nighttime hours.

13 14 15 **Dish Engines**

16
17 The reduced size of the proposed Los Mogotes East SEZ would reduce the maximum
18 potential number of 25-kW dish engines to 9,420 covering 2,120 acres (8.6 km²); the Draft Solar
19 PEIS modeled 21,040 dish engines covering 4,734 acres (19.2 km²). The estimated noise level at
20 the nearest residence about 0.4 mi (0.6 km) from the SEZ boundary would be about 47 dBA,
21 which is higher than the typical daytime mean rural background level of 40 dBA. The estimated
22 day-night average noise level of 46 dBA L_{dn} at these residences is below the EPA guideline of
23 55 dBA L_{dn} for residential areas. The conclusion of the Draft Solar PEIS that noise from dish
24 engines could cause adverse impacts on the nearest residence, depending on background noise
25 levels and meteorological conditions, remains valid.

26
27 As stated above under construction impacts, for this Final Solar PEIS an updated
28 approximate significance threshold of 55 dBA was used to evaluate potential noise impacts on
29 terrestrial wildlife in areas of special concern. The estimated noise level from operation of a dish
30 engine solar facility at the boundary of the Los Mogotes ACEC (about 2 mi [3 km] to the west)
31 is about 41 dBA. This estimated level is below the significance threshold; thus, noise from
32 operations in the proposed Los Mogotes East SEZ is not anticipated to adversely affect wildlife
33 in the nearby specially designated area. However, as discussed in Section 5.10.2, there is the
34 potential for other effects to occur at lower noise levels (Barber et al. 2011). With these impacts
35 and the potential for impacts at lower noise levels, noise impacts on terrestrial wildlife from a
36 dish engine facility would have to be considered on a project-specific basis, including site-
37 specific background levels and hearing sensitivity for site-specific terrestrial wildlife of concern.

38
39 Assuming full build-out of the SEZ with dish engine facilities, the estimated noise level
40 at the West Fork of the North Branch of the Old Spanish Trail (about 1.0 mi [1.6 km] to the east
41 of the SEZ) would be about 46 dBA, which is above the typical daytime mean rural background
42 level of 40 dBA. Dish engine noise from the SEZ could result in minor noise impacts on the
43 West Fork of the North Branch of the Old Spanish Trail.

44
45 Changes in the proposed Los Mogotes East SEZ boundaries would not alter the
46 discussions of vibration, transformer and switchyard noise, and transmission line corona

1 discharge presented in the Draft Solar PEIS. Noise impacts from vibration and transformer and
2 switchyard noise would be minimal. Noise impacts from transmission line corona discharge
3 would be negligible.
4

6 **10.4.15.2.3 Decommissioning and Reclamation**

7

8 The conclusions on decommissioning and reclamation in the proposed Los Mogotes East
9 SEZ as presented in the Draft Solar PEIS remain valid. Decommissioning and reclamation
10 activities would be of short duration, and their potential noise impacts would be minor and
11 temporary. Potential noise and vibration impacts on surrounding communities would be minimal.
12

14 **10.4.15.3 SEZ-Specific Design Features and Design Feature Effectiveness**

15

16 Required programmatic design features that would reduce noise impacts are described in
17 Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the programmatic design
18 features will provide some protection from noise impacts.
19

20 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
21 analyses due to changes to the SEZ boundaries, and consideration of comments received as
22 applicable, no SEZ-specific design features for noise were identified. Some SEZ-specific design
23 features may be identified through the process of preparing parcels for competitive offer and
24 subsequent project-specific analysis.
25

27 **10.4.16 Paleontological Resources**

28

30 **10.4.16.1 Affected Environment**

31

32 Data provided in the Draft Solar PEIS remain valid, with the following updates:
33

- 34 • The ratio of the PFYC in the SEZ has changed with the new footprint; the
35 Class 1 areas of low potential have been reduced from 88% to 73% of the
36 SEZ, and the Class 4/5 areas of higher paleontological potential have been
37 increased from 12% to 27% of the SEZ. In the Class 4/5 areas, the depth of
38 the Alamosa Formation would need to be determined.
- 39 • The BLM Regional Paleontologist may have additional information regarding
40 the paleontological potential of the SEZ and be able to verify the PFYCs of
41 the SEZ as Class 1 and Class 4/5 as used in the Draft Solar PEIS.
42
43
44
45

1 **10.4.16.2 Impacts**
2

3 The assessment provided in the Draft Solar PEIS remains valid. Impacts on significant
4 paleontological resources in the PFYC Class 1 areas are unlikely. In the PFYC Class 4/5 areas,
5 impacts on significant paleontological resources have a greater potential to occur. However, a
6 more detailed look at the geological deposits is needed to determine whether a paleontological
7 survey is warranted.
8

9
10 **10.4.16.3 SEZ-Specific Design Features and Design Feature Effectiveness**
11

12 Required programmatic design features are described in Section A.2.2 of Appendix A
13 of this Final Solar PEIS. Impacts would be minimized through the implementation of required
14 programmatic design features, including a stop-work stipulation in the event that paleontological
15 resources are encountered during construction, as described in Section A.2.2 of Appendix A.
16

17 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
18 comments received as applicable, the following SEZ-specific design feature for paleontological
19 resources has been identified:
20

- 21 • Avoidance of PFYC Class 4/5 areas is recommended for development within
22 the proposed Los Mogotes East SEZ and for access road placement. Where
23 avoidance of Class 4/5 deposits is not possible, a paleontological survey
24 would be required.
25

26 Additional SEZ-specific design features would depend on the results of future
27 paleontological investigations. Some SEZ-specific design features may be identified through
28 the process of preparing parcels for competitive offer and subsequent project-specific analysis.
29

30 As additional information on paleontological resources (e.g., from regional
31 paleontologists or from new surveys) becomes available, the BLM will post the data to a
32 public Web site for use by applicants, the BLM, and other stakeholders.
33

34
35 **10.4.17 Cultural Resources**
36

37
38 **10.4.17.1 Affected Environment**
39

40 Data provided in the Draft Solar PEIS remain valid, with the following updates:
41

- 42 • The new footprint of the SEZ does not include the areas that had been
43 previously surveyed for cultural resources, bringing the percentage of area
44 surveyed down from 0.02% to 0.0%.
45

- 1 • Additional information may be available to characterize the SEZ and its
2 surrounding area in the future (after this Final Solar PEIS is completed), as
3 follows:
 - 4 – Results of an ethnographic study currently being conducted by TRC
5 Solutions, which focuses on Native American use of lands being analyzed
6 for solar development within the San Luis Valley. The study will discuss
7 sensitive and traditional use areas. Interviews with tribal members and
8 field visits will facilitate the identification of resources and sites of
9 traditional and religious importance to tribes.
 - 10 – Results of a Class II sample survey of the SEZ designed to obtain a
11 statistically valid sample of archeological properties and their distribution
12 within the SEZ. Results from the ethnographic study and the sample
13 inventory can be combined to project cultural sensitivity zones as an aid in
14 planning future solar developments.
 - 15 – Identification of the integrity and historical significance of the portion of
16 the West Fork of the North Branch of the Old Spanish National Historic
17 Trail in the vicinity of the SEZ and viewshed analyses from key
18 observation points along the Trail. If this portion of the Trail is determined
19 significant, a mitigation strategy would need to be developed to address
20 unavoidable impacts on the Trail.
 - 21 – Continuation of government-to-government consultation, as described in
22 Section 2.4.3 of the Supplement to the Draft Solar PEIS and IM 2012-032
23 (BLM 2011b), including follow-up to recent ethnographic studies
24 covering some SEZs in Nevada and Utah with tribes not included in the
25 original studies to determine whether those tribes have similar concerns.
26

27 **10.4.17.2 Impacts**

28 The assessment provided in the Draft Solar PEIS remains valid. Impacts on significant
29 cultural resources are possible in the proposed Los Mogotes East SEZ. While no sites have been
30 identified in the SEZ, many significant archaeological sites have been located in close proximity
31 to the SEZ. A survey of the West Fork of the North Branch of the Old Spanish Trail is needed to
32 determine its location, integrity, and the significance of portions of the Trail from which future
33 potential development in the SEZ could be viewed. The assessment provided in the Draft Solar
34 PEIS remains valid with the following update:
35

- 36 • Impacts on significant cultural resources and cultural landscapes associated
37 with American Latino heritage are possible throughout the San Luis Valley.
38

39 **10.4.17.3 SEZ-Specific Design Features and Design Feature Effectiveness**

40 Required programmatic design features that would reduce impacts on cultural resources
41 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Programmatic design
42 features will be applied to address SEZ-specific resources and conditions, for example:
43

- 1 • For projects in the Los Mogotes SEZ that are located within the viewshed of
2 the West Fork of the North Branch of the Old Spanish Trail, a National Trail
3 inventory will be required to determine the area of possible adverse impact
4 on resources, qualities, values, and associated settings of the Trail; to
5 prevent substantial interference; and to determine any areas unsuitable for
6 development. Residual impacts will be avoided, minimized, and/or mitigated
7 to the extent practicable according to program policy standards. Programmatic
8 design features have been included in BLM's Solar Energy Program to
9 address impacts on National Historic Trails (see Section A.2.2.23 of
10 Appendix A).

11
12 Programmatic design features also assume that the necessary surveys, evaluations, and
13 consultations will occur. Ongoing consultation with the Colorado SHPO and the appropriate
14 Native American governments would be conducted during the development of the proposed
15 Los Mogotes East SEZ. It is likely that adverse effects on significant resources in the valley
16 could be mitigated to some degree through such efforts, although mitigation will not eliminate
17 the adverse effects unless significant resources are avoided entirely.

18
19 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration
20 of comments received as applicable, the following SEZ-specific design features have been
21 identified:

- 22
23 • Development of an MOA may be needed among the BLM, Colorado SHPO,
24 and other parties, such as the ACHP, to address the adverse effects of solar
25 energy development on historic properties. The agreement may specify
26 avoidance, minimization, or mitigation measures. Should an MOA be
27 developed to resolve adverse effects on the West Fork of the North Branch
28 of the Old Spanish Trail, the Trail Administration for the Old Spanish Trail
29 (BLM-NMSO and National Park Service [NPS] Intermountain Trails Office,
30 Santa Fe) should be included in the development of that MOA.
- 31
32 • Additional coordination with the CTSR Commission is recommended to
33 address possible mitigation measures for reducing visual impacts on the
34 CTSR.

35
36 The need for and nature of additional SEZ-specific design features will depend on the
37 results of future investigations. Some additional SEZ-specific design features may be identified
38 through the process of preparing parcels for competitive offer and subsequent project-specific
39 analysis.

1 **10.4.18 Native American Concerns**

2
3
4 **10.4.18.1 Affected Environment**

5
6 Data provided in the Draft Solar PEIS remain valid but will be supplemented in the
7 future by the results of the ethnographic study being completed in the San Luis Valley (see
8 Section 10.1.17.1).
9

10
11 **10.4.18.2 Impacts**

12
13 The description of potential concerns provided in the Draft Solar PEIS remains valid. No
14 direct impacts from solar energy development are likely to occur to culturally significant areas
15 (i.e., San Luis Lakes, the Great Sand Dunes, and Blanca Peak); however, indirect visual and
16 auditory impacts are possible. It is likely that traditional plant resources and animal habitats
17 would be directly affected with solar energy development in the proposed Los Mogotes East
18 SEZ.
19

20
21 **10.4.18.3 SEZ-Specific Design Features and Design Feature Effectiveness**

22
23 Required programmatic design features that would reduce impacts on Native American
24 concerns are described in Section A.2.2 of Appendix A of this Final Solar PEIS. For example,
25 impacts would be minimized through the implementation of required programmatic design
26 features such as avoidance of sacred sites, water sources, and tribally important plant and animal
27 species. Programmatic design features assume that the necessary surveys, evaluations, and
28 consultations will occur. The tribes would be notified regarding the results of archaeological
29 surveys, and they would be contacted immediately upon any discovery of Native American
30 human remains and associated cultural items.
31

32 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
33 comments received as applicable, no SEZ-specific design features to address Native American
34 concerns have been identified. The need for and nature of SEZ-specific design features would be
35 determined during government-to-government consultation with affected tribes as part of the
36 process of preparing parcels for competitive offer and subsequent project-specific analysis.
37 Potentially significant sites and landscapes the SEZ associated with Blanca Peak, Great Sand
38 Dunes, and San Luis Lakes, as well as trail systems, mountain springs, mineral resources, burial
39 sites, ceremonial areas, water resources, and plant and animal resources, should be considered
40 and discussed during consultation.
41
42
43

1 **10.4.19 Socioeconomics**

2
3
4 **10.4.19.1 Affected Environment**

5
6 Although the boundaries of the Los Mogotes East SEZ have been reduced compared to
7 the boundaries given in the Draft Solar PEIS, the socioeconomic ROI, the area in which site
8 employees would live and spend their wages and salaries, and into which any in-migration
9 would occur, includes the same counties and communities as described in the Draft Solar PEIS,
10 meaning that no updates to the affected environment information given in the Draft Solar PEIS
11 are required.
12

13
14 **10.4.19.2 Impacts**

15
16 Socioeconomic resources in the ROI around the SEZ could be affected by solar energy
17 development through the creation of direct and indirect employment and income, the generation
18 of direct sales and income taxes, SEZ acreage rental and capacity payments to BLM, the
19 in-migration of solar facility workers and their families, impacts on local housing markets, and
20 on local community service employment. The impact assessment provided in the Draft Solar
21 PEIS remains valid, with the following updates.
22

23
24 **10.4.19.2.1 Solar Trough**

25
26
27 **Construction**

28
29 Total construction employment impacts in the ROI (including direct and indirect impacts)
30 in 2021 from the use of solar trough technologies would be 2,039 jobs (Table 10.4.19.2-1).
31 Construction activities would constitute 3.1% of total ROI employment. A solar development
32 would also produce \$108.6 million in income. Direct sales taxes would be \$0.1 million; direct
33 income taxes, \$4.2 million.
34

35 With the scale of construction activities and the low likelihood that the entire
36 construction workforce in the required occupational categories would be available in the ROI,
37 construction of a solar facility would mean that some in-migration of workers and their families
38 from outside the ROI would be required, with up to 1,291 persons in-migrating into the ROI.
39 Although in-migration may potentially affect local housing markets, the relatively small number
40 of in-migrants and the availability of temporary accommodations (hotels, motels, and mobile
41 home parks) would mean that the impact of solar facility construction on the number of vacant
42 rental housing units is not expected to be large, with up to 446 rental units expected to be
43 occupied in the ROI. This occupancy rate would represent 13.8% of the vacant rental units
44 expected to be available in the ROI.
45

1

TABLE 10.4.19.2-1 ROI Socioeconomic Impacts Assuming Full Build-out of the Proposed Los Mogotes East SEZ as Revised with Trough Facilities

Parameter	Maximum Annual Construction Impacts ^a	Annual Operations Impacts ^b
Employment (no.)		
Direct	1,160	92
Total	2,039	145
Income ^c		
Total	108.6	4.6
Direct state taxes ^c		
Sales	0.1	0.1
Income	4.2	0.1
BLM payments ^c		
Rental	NA ^d	0.2
Capacity ^e	NA	2.8
In-migrants (no.)	1,291	59
Vacant housing ^f (no.)	446	37
Local community service employment		
Teachers (no.)	15	1
Physicians (no.)	2	0
Public safety (no.)	1	0

^a Construction impacts were based on the development at the site in a single year; it was assumed that several facilities with a combined capacity of up to 424 MW (corresponding to 2,120 acres [9 km²] of land disturbance) could be built.

^b Operations impacts were based on full build-out of the site, producing a total output of 424 MW.

^c Values are reported in \$ million 2008.

^d NA = not applicable.

^e The BLM annual capacity payment was based on a fee of \$6,570/MW, established by the BLM in its Solar Energy Interim Rental Policy (BLM 2010), assuming a solar facility with no storage capability, and full build-out of the site. Projects with three or more hours of storage would generate higher payments, based on a fee of \$7,884/MW.

^f Construction activities would affect vacant rental housing; operations activities would affect vacant owner-occupied housing.

4

1 In addition to the potential impact on housing markets, in-migration would affect
2 community service (education, health, and public safety) employment. An increase in such
3 employment would be required to meet existing levels of service in the ROI. Accordingly, up to
4 15 new teachers, 2 physicians, and 1 public safety employee (career firefighters and uniformed
5 police officers) would be required in the ROI. These increases would represent 1.4% of total ROI
6 employment expected in these occupations.
7
8

9 **Operations**

10
11 Total operations employment impacts in the ROI (including direct and indirect
12 impacts) of a full build-out of the SEZ using solar trough technologies would be 145 jobs
13 (Table 10.4.19.2-1). Such a solar development would also produce \$4.6 million in income.
14 Direct sales taxes would be \$0.1 million; direct income taxes, \$0.1 million. Based on fees
15 established by the BLM (BLM 2010), acreage rental payments would be \$0.2 million, and solar
16 generating capacity payments at least \$2.8 million.
17

18 As for the construction workforce, operation of a solar facility likely would require
19 some in-migration of workers and their families from outside the ROI, with up to 59 persons
20 in-migrating into the ROI. Although in-migration may potentially affect local housing markets,
21 the relatively small number of in-migrants and the availability of temporary accommodations
22 (hotels, motels, and mobile home parks) would mean that the impact of solar facility operation
23 on the number of vacant owner-occupied housing units is not expected to be large, with up to
24 37 owner-occupied units expected to be occupied in the ROI.
25

26 In addition to the potential impact on housing markets, in-migration would affect
27 community service (education, health, and public safety) employment. An increase in such
28 employment would be required to meet existing levels of service in the ROI. Accordingly,
29 one new teacher would be required in the ROI.
30
31
32

33 ***10.4.19.2.2 Power Tower***

34 **Construction**

35
36
37
38 Total construction employment impacts in the ROI (including direct and indirect impacts)
39 in 2021 from the use of power tower technologies would be 812 jobs (Table 10.4.19.2-2).
40 Construction activities would constitute 1.2% of total ROI employment. Such a solar
41 development would also produce \$43.3 million in income. Direct sales taxes would be less
42 than \$0.1 million; direct income taxes, \$1.7 million.
43

44 With the scale of construction activities and the low likelihood that the entire
45 construction workforce in the required occupational categories would be available in the ROI,
46 construction of a solar facility would mean that some in-migration of workers and their families

^a Construction impacts were based on the development at the site in a single year; it was assumed that several facilities with a combined capacity of up to 236 MW (corresponding to 2,120 acres [12 km²] of land disturbance) could be built.

^b Operations impacts were based on full build-out of the site, producing a total output of 236 MW.

^c Values are reported in \$ million 2008.

^d NA = not applicable.

^e The BLM annual capacity payment was based on a fee of \$6,570/MW, established by the BLM in its Solar Energy Interim Rental Policy (BLM 2010), assuming a solar facility with no storage capability, and full build-out of the site. Projects with three or more hours of storage would generate higher payments, based on a fee of \$7,884/MW.

^f Construction activities would affect vacant rental housing; operations activities would affect vacant owner-occupied housing.

4

1 from outside the ROI would be required, with up to 514 persons in-migrating into the ROI.
2 Although in-migration may potentially affect local housing markets, the relatively small number
3 of in-migrants and the availability of temporary accommodations (hotels, motels, and mobile
4 home parks) would mean that the impact of solar facility construction on the number of vacant
5 rental housing units is not expected to be large, with up to 178 rental units expected to be
6 occupied in the ROI. This occupancy rate would represent 5.5% of the vacant rental units
7 expected to be available in the ROI.
8

9 In addition to the potential impact on housing markets, in-migration would affect
10 community service (education, health, and public safety) employment. An increase in such
11 employment would be required to meet existing levels of service in the ROI. Accordingly, up
12 to six new teachers, one physician, and one public safety employee (career firefighters and
13 uniformed police officers) would be required in the ROI. These increases would represent 0.5%
14 of total ROI employment expected in these occupations.
15

16 **Operations**

17
18
19 Total operations employment impacts in the ROI (including direct and indirect
20 impacts) of a full build-out of the SEZ using power tower technologies would be 67 jobs
21 (Table 10.4.19.2-2). Such a solar development would also produce \$2.1 million in income.
22 Direct sales taxes would be less than \$0.1 million; direct income taxes, \$0.1 million. Based on
23 fees established by the BLM (BLM 2010), acreage rental payments would be \$0.2 million, and
24 solar generating capacity payments, at least \$1.5 million.
25

26 As for the construction workforce, operation of a solar facility likely would require some
27 in-migration of workers and their families from outside the ROI, with up to 30 persons
28 in-migrating into the ROI. Although in-migration may potentially affect local housing markets,
29 the relatively small number of in-migrants and the availability of temporary accommodations
30 (hotels, motels, and mobile home parks) would mean that the impact of solar facility operation
31 on the number of vacant owner-occupied housing units is not expected to be large, with up to
32 19 owner-occupied units expected to be required in the ROI.
33

34 No new community service employment would be required to meet existing levels of
35 service in the ROI.
36

^a Construction impacts were based on the development at the site in a single year; it was assumed that several facilities with a combined capacity of up to 236 MW (corresponding to 2,120 acres [12 km²] of land disturbance) could be built.

^b Operations impacts were based on full build-out of the site, producing a total output of 236 MW.

^c Values are reported in \$ million 2008.

^d NA = not applicable.

^e The BLM annual capacity payment was based on a fee of \$6,570/MW, established by the BLM in its Solar Energy Interim Rental Policy (BLM 2010), assuming a solar facility with no storage capability, and full build-out of the site. Projects with three or more hours of storage would generate higher payments, based on a fee of \$7,884/MW.

^f Construction activities would affect vacant rental housing; operations activities would affect vacant owner-occupied housing.

1 produce \$17.6 million in income. Direct sales taxes would be less than \$0.1 million; direct
2 income taxes, \$0.7 million.

3
4 With the scale of construction activities and the low likelihood that the entire
5 construction workforce in the required occupational categories would be available in the ROI,
6 construction of a solar facility would mean that some in-migration of workers and their families
7 from outside the ROI would be required, with up to 209 persons in-migrating into the ROI.
8 Although in-migration may potentially affect local housing markets, the relatively small number
9 of in-migrants and the availability of temporary accommodations (hotels, motels, and mobile
10 home parks) would mean that the impact of solar facility construction on the number of vacant
11 rental housing units is not expected to be large, with up to 72 rental units expected to be
12 occupied in the ROI. This occupancy rate would represent 2.2% of the vacant rental units
13 expected to be available in the ROI.

14
15 In addition to the potential impact on housing markets, in-migration would also affect
16 community service (education, health, and public safety) employment. An increase in such
17 employment would be required to meet existing levels of service in the ROI. Accordingly, up to
18 two new teachers would be required in the ROI. These increases would represent 0.2% of total
19 ROI employment expected in these occupations.

20 21 22 **Operations**

23
24 Total operations employment impacts in the ROI (including direct and indirect
25 impacts) of a full build-out of the SEZ using dish engine technologies would be 66 jobs
26 (Table 10.4.19.2-3). Such a solar development would also produce \$2.0 million in income.
27 Direct sales taxes would be less than \$0.1 million; direct income taxes, \$0.1 million. Based on
28 fees established by the BLM (BLM 2010), acreage rental payments would be \$0.2 million, and
29 solar generating capacity payments, at least \$1.5 million.

30
31 As for the construction workforce, operation of a solar facility likely would require some
32 in-migration of workers and their families from outside the ROI, with up to 30 persons
33 in-migrating into the ROI. Although in-migration may potentially affect local housing markets,
34 the relatively small number of in-migrants and the availability of temporary accommodations
35 (hotels, motels, and mobile home parks) would mean that the impact of solar facility operation
36 on the number of vacant owner-occupied housing units is not expected to be large, with up to
37 18 owner-occupied units expected to be required in the ROI.

38
39 No new community service employment would be required to meet existing levels of
40 service in the ROI.

1 **10.4.19.2.4 Photovoltaic**

2
3
4 **Construction**

5
6 Total construction employment impacts in the ROI (including direct and indirect impacts)
7 from the use of PV technologies would be 154 jobs (Table 10.4.19.2-4). Construction activities
8 would constitute 0.2% of total ROI employment. Such a solar development would also produce
9 \$8.2 million in income. Direct sales taxes would be less than \$0.1 million; direct income taxes,
10 \$0.3 million.

11
12 With the scale of construction activities and the low likelihood that the entire
13 construction workforce in the required occupational categories would be available in the ROI,
14 construction of a solar facility would mean that some in-migration of workers and their families
15 from outside the ROI would be required, with up to 98 persons in-migrating into the ROI.
16 Although in-migration may potentially affect local housing markets, the relatively small number
17 of in-migrants and the availability of temporary accommodations (hotels, motels, and mobile
18 home parks) would mean that the impact of solar facility construction on the number of vacant
19 rental housing units is not expected to be large, with up to 34 rental units expected to be
20 occupied in the ROI. This occupancy rate would represent 1.0% of the vacant rental units
21 expected to be available in the ROI.

22
23 In addition to the potential impact on housing markets, in-migration would affect
24 community service (education, health, and public safety) employment. An increase in such
25 employment would be required to meet existing levels of service in the ROI. Accordingly,
26 one new teacher would be required in the ROI. This increase would represent 0.1% of total ROI
27 employment expected in this occupation.

28
29
30 **Operations**

31
32 Total operations employment impacts in the ROI (including direct and indirect impacts)
33 of a full build-out on the SEZ using PV technologies would be seven jobs (Table 10.4.19.2-4).
34 Such a solar development would also produce \$0.2 million in income. Direct sales taxes would
35 be less than \$0.1 million; direct income taxes, less than \$0.1 million. Based on fees established
36 by the BLM (BLM 2010), acreage rental payments would be \$0.2 million, and solar generating
37 capacity payments at least \$1.2 million.

38
39 As for the construction workforce, operation of a solar facility likely would require some
40 in-migration of workers and their families from outside the ROI, with up to three persons
41 in-migrating into the ROI. Although in-migration may potentially affect local housing markets,
42 the relatively small number of in-migrants and the availability of temporary accommodations
43 (hotels, motels, and mobile home parks) would mean that the impact of solar facility operation
44 on the number of vacant owner-occupied housing units is not expected to be large, with up to
45 two owner-occupied units expected to be required in the ROI.

Teachers (no.)	1	0
Physicians (no.)	0	0
Public safety (no.)	0	0

^a Construction impacts were based on the development at the site in a single year; it was assumed that several facilities with a combined capacity of up to 236 MW (corresponding to 2,120 acres [12 km²] of land disturbance) could be built.

^b Operations impacts were based on full build-out of the site, producing a total output of 236 MW.

^c Values are reported in \$ million 2008.

^d NA = not applicable.

^e The BLM annual capacity payment was based on a fee of \$5,256/MW, established by the BLM in its Solar Energy Interim Rental Policy (BLM 2010), assuming full build-out of the site.

^f Construction activities would affect vacant rental housing; operations activities would affect owner-occupied housing.

4
5

1 No new community service employment would be required to meet existing levels of
2 service in the ROI.

3 4 5 **10.4.19.3 SEZ-Specific Design Features and Design Feature Effectiveness** 6

7 Required programmatic design features that will reduce socioeconomic impacts are
8 described in Appendix A of this Final Solar PEIS. Implementing the programmatic design
9 features will reduce the potential for socioeconomic impacts during all project phases.
10

11 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
12 analyses due to changes to the SEZ boundaries, and consideration of comments received as
13 applicable, no SEZ-specific design features to address socioeconomic impacts have been
14 identified. Some SEZ-specific design features may be identified through the process of
15 preparing parcels for competitive offer and subsequent project-specific analysis.
16

17 18 **10.4.20 Environmental Justice** 19

20 21 **10.4.20.1 Affected Environment** 22

23 The data presented in the Draft Solar PEIS have changed due to the change in boundaries
24 of the proposed Los Mogotes East SEZ.
25

26 The data in Table 10.4.20.1-1 show the minority and low-income composition of the total
27 population located within a 50-mi (80-km) radius of the proposed SEZ based on 2000 Census
28 data and CEQ guidelines (CEQ 1997). Individuals identifying themselves as Hispanic or Latino
29 are included in the table as a separate entry. However, because Hispanics can be of any race, this
30 number also includes individuals also identifying themselves as being part of one or more of the
31 population groups listed in the table.
32

33 A large number of minority and low-income individuals are located in the 50-mi (80-km)
34 area around the boundary of the SEZ. Within the 50-mi (80-km) radius in Colorado, 47.3% of
35 the population is classified as minority, while 19.5% is classified as low-income. Although the
36 number of minority individuals does not exceed 50% of the total population in the area, the
37 number of minority individuals exceeds the state average by 20 percentage points or more; that
38 is, there is a minority population in the Colorado portion of the 50-mi (80-km) area based on
39 2000 Census data and CEQ guidelines. The number of low-income individuals does not exceed
40 the state average by 20 percentage points or more and does not exceed 50% of the total
41 population in the area; that is, there are no low-income populations in the Colorado portion of
42 the SEZ.
43

44 Within the 50-mi (80-km) radius in New Mexico, 58.0% of the population is classified as
45 minority, while 18.4% is classified as low-income. Although the number of minority individuals
46 does not exceed the state average by 20 percentage points or more, the minority population

1
2

4
5
6
7
8
9
10
11
12

exceeds 50% of the total population in the area, meaning that there are minority populations in the New Mexico portion of the 50-mi (80-km) area based on 2000 Census data and CEQ guidelines. The number of low-income individuals does not exceed the state average by 20 percentage points or more and does not exceed 50% of the total population in the area, meaning that there are no low-income populations in the New Mexico portion of the 50-mi (80-km) area.

13
14
15
16
17
18
19
20

In the Colorado portion of the 50-mi (80-km) radius around the SEZ, more than 50% of the population in all but one of the block groups in Conejos County is made up of minority population groups, together with all the block groups in the adjacent Costilla County. Block groups in the cities of Alamosa (Alamosa County), Monte Vista and Del Norte (both in Rio Grande County), and Center (Saguache County) are also more than 50% minority. In the New Mexico portion of the area, Rio Arriba County has three block groups in which the minority population is more than 20 percentage points higher than the state average and one block group that is more than 50% minority, while Taos County has three block groups with more than 50%

1 minority, and one block group where the minority population is 20 percentage points higher than
2 the state average.

3
4 Low-income populations in the 50-mi (80-km) radius are limited to five block groups in
5 the Colorado portion, in the cities of San Luis (Costilla County), Center (Saguache County) and
6 Alamosa, all of which have low-income population shares that are more than 20 percentage
7 points higher than the state average.

8
9 Figures 10.4.20.1-1 and 10.4.20.1-2 show the locations of minority and low-income
10 population groups in the 50-mi (80-km) radius around the boundary of the SEZ.

11 12 13 **10.4.20.2 Impacts**

14
15 Environmental justice concerns common to all utility-scale solar energy projects are
16 described in detail in Section 5.18. These impacts will be minimized through the implementation
17 of programmatic design features described in Section A.2.2 of Appendix A, which address the
18 underlying environmental impacts contributing to the concerns. The potentially relevant
19 environmental impacts associated with solar development within the proposed SEZ include noise
20 and dust during the construction of solar facilities; noise and EMF effects associated with solar
21 project operations; the visual impacts of solar generation and auxiliary facilities, including
22 transmission lines; access to land used for economic, cultural, or religious purposes; and effects
23 on property values as areas of concern that might potentially affect minority and low-income
24 populations.

25
26 Potential impacts on low-income and minority populations could be incurred as a result
27 of the construction and operation of solar facilities involving each of the four technologies.
28 Although impacts are likely to be small, there are minority populations defined by CEQ
29 guidelines (see Section 10.4.20.1) within both the Colorado and New Mexico portions of the
30 50-mi (80-km) radius around the boundary of the SEZ; thus, any adverse impacts of solar
31 projects would disproportionately affect minority populations. Further analysis of these impacts
32 would be included in subsequent NEPA reviews of individual solar projects. Because there are
33 no low-income populations within the 50-mi (80-km) radius, according to CEQ guidelines, there
34 would not be any impacts on low-income populations.

35 36 37 **10.4.20.3 SEZ-Specific Design Features and Design Feature Effectiveness**

38
39 Required programmatic design features that would reduce potential environmental justice
40 impacts are described in Appendix A of this Final Solar PEIS. Implementing the programmatic
41 design features will reduce the potential for environmental justice impacts.

42
43 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
44 analyses due to changes to the SEZ boundaries, and consideration of comments received as
45 applicable, no SEZ-specific design features for environmental justice have been identified. Some
46

2 **FIGURE 10.4.20.1-1 Minority Population Groups within the 50-mi (80-km) Radius Surrounding**

3 **the Proposed Los Mogotes East SEZ as Revised**

1

2 **FIGURE 10.4.20.1-2 Low-Income Population Groups within the 50-mi (80-km) Radius**
 3 **Surrounding the Proposed Los Mogotes East SEZ as Revised**

1 SEZ-specific design features may be identified through the process of preparing parcels for
2 competitive offer and subsequent project-specific analysis.

3 4 5 **10.4.21 Transportation**

6 7 8 **10.4.21.1 Affected Environment**

9
10 The reduction in size of the SEZ does not change the information on affected
11 environment for transportation presented in the Draft Solar PEIS.

12 13 14 **10.4.21.2 Impacts**

15
16 As stated in the Draft Solar PEIS, the primary transportation impacts are anticipated to
17 be from commuting worker traffic. U.S. 285 provides a regional traffic corridor that could
18 experience moderate impacts for single projects that may have up to 1,000 daily workers with an
19 additional 2,000 vehicle trips per day (maximum), an increase that is about half of the current
20 daily traffic levels for U.S. 285. In addition, local road improvements might be necessary on the
21 county roads between U.S. 285 and the SEZ. Improvements would be necessary in any portion
22 of the SEZ that might be developed so as not to overwhelm the local roads near any site access
23 point(s).

24
25 Solar development within the SEZ would affect public access along OHV routes that
26 are designated open and available for public use. Although open routes crossing areas granted
27 ROWs for solar facilities could be redesignated as closed (see Section 5.5.1 of the Draft Solar
28 PEIS), a programmatic design feature has been included under Recreation (Section A.2.2.6.1 of
29 Appendix A) that requires consideration of replacement of lost OHV route acreage and of access
30 across and to public lands.

31 32 33 **10.4.21.3 SEZ-Specific Design Features and Design Feature Effectiveness**

34
35 Required programmatic design features that would reduce transportation impacts are
36 described in Appendix A of this Final Solar PEIS. The programmatic design features, including
37 local road improvements, multiple site access locations, staggered work schedules, and ride-
38 sharing, will all provide some relief to traffic congestion on local roads leading to the SEZ.
39 Depending on the location of solar facilities within the SEZ, more specific access locations and
40 local road improvements could be implemented.

41
42 On the basis of impact analyses conducted for the Draft Solar PEIS, updates to those
43 analyses due to changes to the SEZ boundaries, and consideration of comments received as
44 applicable, no SEZ-specific design features to address transportation impacts have been
45 identified. Some SEZ-specific design features may be identified through the process of preparing
46 parcels for competitive offer and subsequent project-specific analysis.

1 **10.4.22 Cumulative Impacts**
2

3 The analysis of potential impacts in the vicinity of the proposed Los Mogotes East SEZ
4 presented in the Draft Solar PEIS is still generally applicable for this Final Solar PEIS, although
5 the impacts would be decreased because the size of the proposed SEZ has been reduced to
6 2,650 acres (10.7 km²). The following sections include an update to the information presented in
7 the Draft Solar PEIS regarding cumulative effects for the proposed Los Mogotes East SEZ.
8
9

10 **10.4.22.1 Geographic Extent of the Cumulative Impact Analysis**
11

12 The geographic extent of the cumulative impact analysis has not changed. The extent
13 varies on the basis of the nature of the resource being evaluated and the distance at which an
14 impact may occur (thus, e.g., air quality impacts may have a greater regional extent than cultural
15 resources impacts). Lands around the SEZ are privately owned or administered by the USFS,
16 NPS, or BLM. The BLM administers approximately 11% of the lands within a 50-mi (80-km)
17 radius of the Los Mogotes East SEZ.
18
19

20 **10.4.22.2 Overview of Ongoing and Reasonably Foreseeable Future Actions**
21

22 The proposed Los Mogotes East SEZ decreased from 5,918 acres (24.0 km²) to
23 2,650 acres (10.7 km²). The Draft Solar PEIS included three other proposed SEZs in Colorado:
24 Antonito Southwest, De Tilla Gulch, and Fourmile East. All these proposed SEZs are being
25 carried forward to the Final Solar PEIS; the areas of the De Tilla Gulch and Fourmile East SEZs
26 have been reduced.
27

28 The ongoing and reasonably foreseeable future actions described below are grouped into
29 two categories: (1) actions that relate to energy production and distribution, including potential
30 solar energy projects under the proposed action (Section 10.4.22.2.1); and (2) other ongoing and
31 reasonably foreseeable actions, including those related to electric power generation and
32 distribution, wildlife management, and military facility improvement (Section 10.4.22.2.2).
33 Together, these actions and trends have the potential to affect human and environmental
34 receptors within the geographic range of potential impacts over the next 20 years.
35
36

37 ***10.4.22.2.1 Energy Production and Distribution***
38

39 The list of reasonably foreseeable future actions near the proposed Los Mogotes East
40 SEZ has been updated and is presented in Table 10.4.22.2-1. Projects listed in the table are
41 shown in Figure 10.4.22.2-1.
42

43 Xcel Energy (Public Service Company of Colorado) has submitted a transmission
44 planning report to the Colorado Public Utility Commission stating that it intends to end its
45 involvement in the proposed San Luis Valley–Calumet–Comanche Transmission project
46 (Heide 2011). The project itself has not been cancelled.

 3 **Projects on Public Land within a 50-mi (80-km) Radius of the Proposed Los Mogotes East SEZ**
 4 **as Revised**

1 **10.4.22.2 Other Actions**

2
3 None of the major ongoing and foreseeable actions within 50 mi (80 km) of the proposed
4 Los Mogotes East SEZ that were listed in Table 10.4.22.2-3 of the Draft Solar PEIS have had a
5 change in their status.
6

7
8 **10.4.22.3 General Trends**

9
10 The information on general trends presented in the Draft Solar PEIS remains valid.
11

12
13 **10.4.22.4 Cumulative Impacts on Resources**

14
15 Total disturbance in the proposed Los Mogotes East SEZ over 20 years is assumed to
16 be about 2,120 acres (8.6 km²) (80% of the entire proposed SEZ). This development would
17 contribute incrementally to the impacts from other past, present, and reasonably foreseeable
18 future actions in the region as described in the Draft Solar PEIS. Primary impacts from
19 development in the Los Mogotes East SEZ may include impacts on water quantity and quality,
20 air quality, ecological resources such as habitat and species, cultural and visual resources, and
21 specially designated lands.
22

23 No additional major actions have been identified within 50 mi (80 km) of the SEZ. As a
24 result of the reduction in the developable area of the SEZ as well as that of the nearby Fourmile
25 East SEZ, the incremental cumulative impacts associated with development in the proposed
26 Los Mogotes East SEZ during construction, operation, and decommissioning are expected to
27 be the same or less than those discussed in the Draft Solar PEIS.
28

29 On the basis of comments received on the Draft Solar PEIS, cumulative impacts on
30 recreation in the San Luis Valley have been reconsidered. While it is unlikely that the proposed
31 Los Mogotes East SEZ would have a large impact on recreational use or tourism throughout the
32 valley, cumulative impacts could occur because it is one of four proposed SEZs totaling about
33 16,300 acres (66 km²) on public lands, and there are additional solar energy developments on
34 private lands. Because most of the land on the valley floor of the San Luis Valley is private and
35 is heavily developed for agricultural use, undeveloped public lands around the valley provide
36 accessible areas for public recreation. Although it is believed the recreational use of the proposed
37 SEZ is low, the loss of public access to such areas cumulatively leads to an overall reduction in
38 the availability of recreation that can become significant.
39

40
41 **10.4.23 Transmission Analysis**

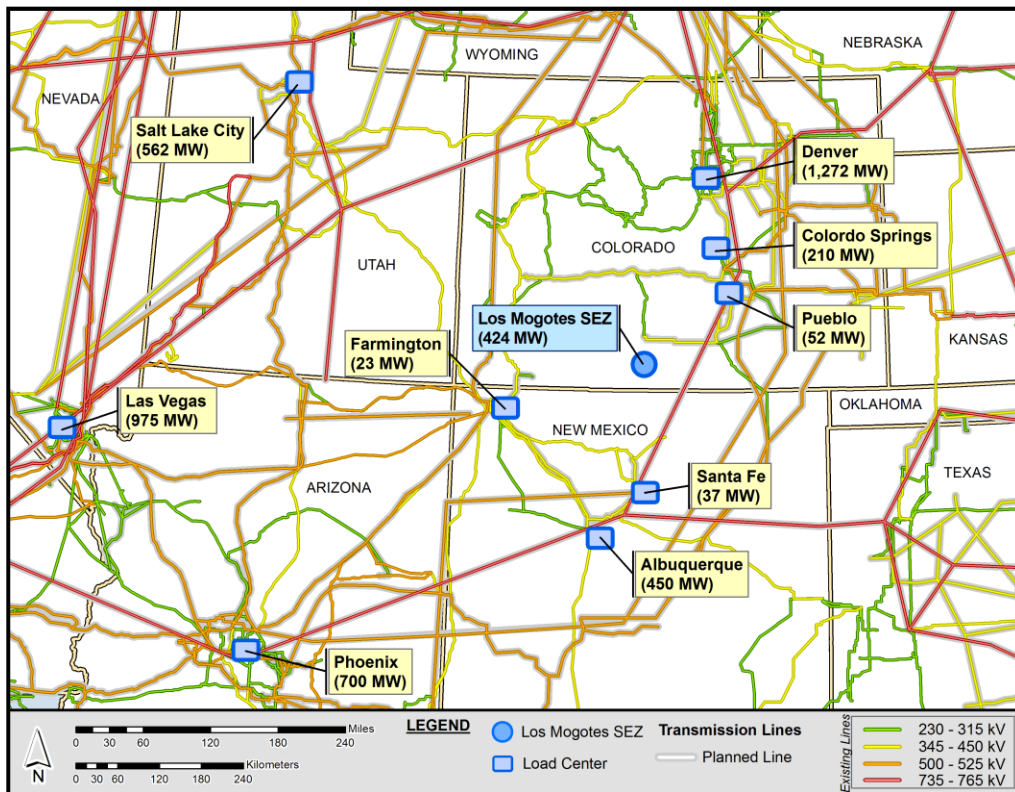

42
43 The methodology for this transmission analysis is described in Appendix G of this Final
44 Solar PEIS. This section presents the results of the transmission analysis for the Los Mogotes
45 East SEZ, including the identification of potential load areas to be served by power generated at
46 the SEZ and the results of the DLT analysis. Unlike Sections 10.4.2 through 10.4.22, this section

1 is not an update of previous analysis for the Los Mogotes East SEZ; this analysis was not
 2 presented in the Draft Solar PEIS. However, the methodology and a test case analysis were
 3 presented in the Supplement to the Draft Solar PEIS. Comments received on the material
 4 presented in the Supplement were used to improve the methodology for the assessment presented
 5 in this Final Solar PEIS.
 6

7 On the basis of its size, the assumption of a minimum of 5 acres (0.02 km²) of land
 8 required per MW, and the assumption of a maximum of 80% of the land area developed, the
 9 Los Mogotes East SEZ is estimated to have the potential to generate 424 MW of marketable
 10 solar power at full build-out.
 11
 12

13 10.4.23.1 Identification and Characterization of Load Areas

14
 15 The primary candidates for Los Mogotes East SEZ load areas are the major surrounding
 16 cities. Figure 10.4.23.1-1 shows the possible load areas for the Los Mogotes East SEZ and the
 17 estimated portion of their market that could be served by solar generation. Possible load areas
 18 for the Los Mogotes East SEZ include Pueblo, Colorado Springs, and Denver, Colorado;
 19 Farmington, Albuquerque, and Santa Fe, New Mexico; Salt Lake City, Utah; Phoenix, Arizona;
 20 and Las Vegas, Nevada.
 21
 22

23
 24 **FIGURE 10.4.23.1-1 Locations of the Proposed Los Mogotes East SEZ and**
 25 **Possible Load Areas (Source for background map: Platts 2011)**

1 The two load area groups examined for the Los Mogotes East SEZ are as follows:

- 2
3 1. Pueblo, Colorado Springs, and Denver, Colorado, and
4
5 2. Farmington and Albuquerque, New Mexico.
6

7 Figure 10.4.23.1-2 shows the most economically viable transmission scheme for the
8 Los Mogotes East SEZ (transmission scheme 1), and Figure 10.4.23.1-3 shows an alternative
9 transmission scheme (transmission scheme 2) that represents a logical choice should
10 transmission scheme 1 be infeasible. As described in Appendix G, the alternative shown in
11 transmission scheme 2 represents the optimum choice if one or more of the primary linkages in
12 transmission scheme 1 are excluded from consideration. The groups provide for linking loads
13 along alternative routes so that the SEZ's output of 424 MW could be fully allocated.
14

15 Table 10.4.23.1-1 summarizes and groups the load areas according to their associated
16 transmission scheme and provides details on how the megawatt load for each area was estimated.
17
18

19 10.4.23.2 Findings for the DLT Analysis

20
21 The DLT analysis approach assumes that the proposed Los Mogotes East SEZ will
22 require all new construction for transmission lines (i.e., dedicated lines) and substations. The
23
24

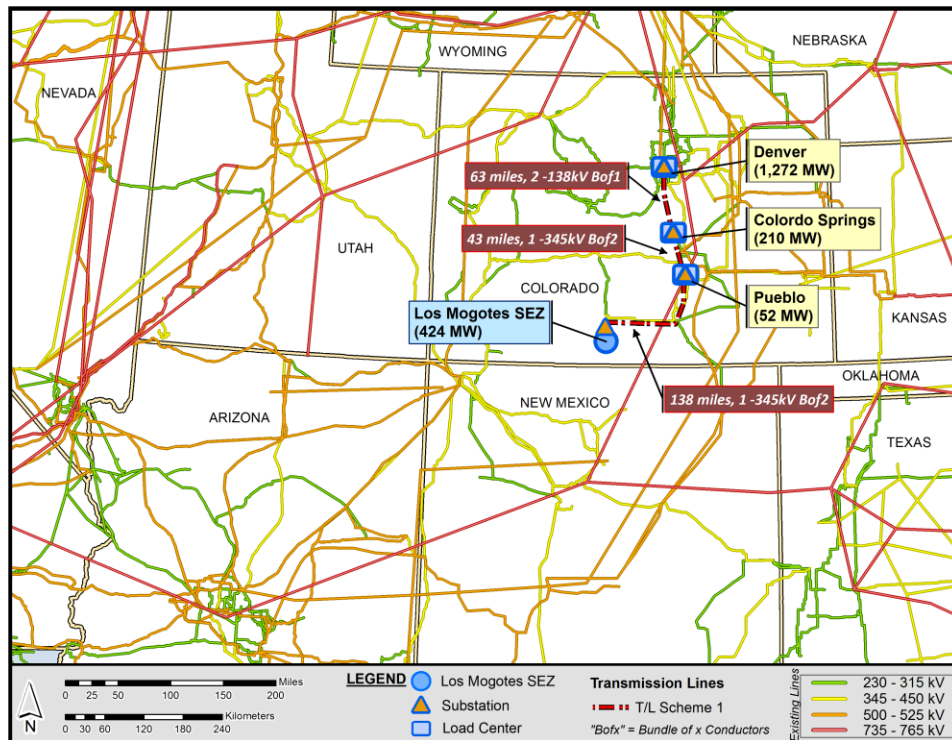

FIGURE 10.4.23.1-2 Transmission Scheme 1 for the Proposed Los Mogotes East SEZ (Source for background map: Platts 2011)

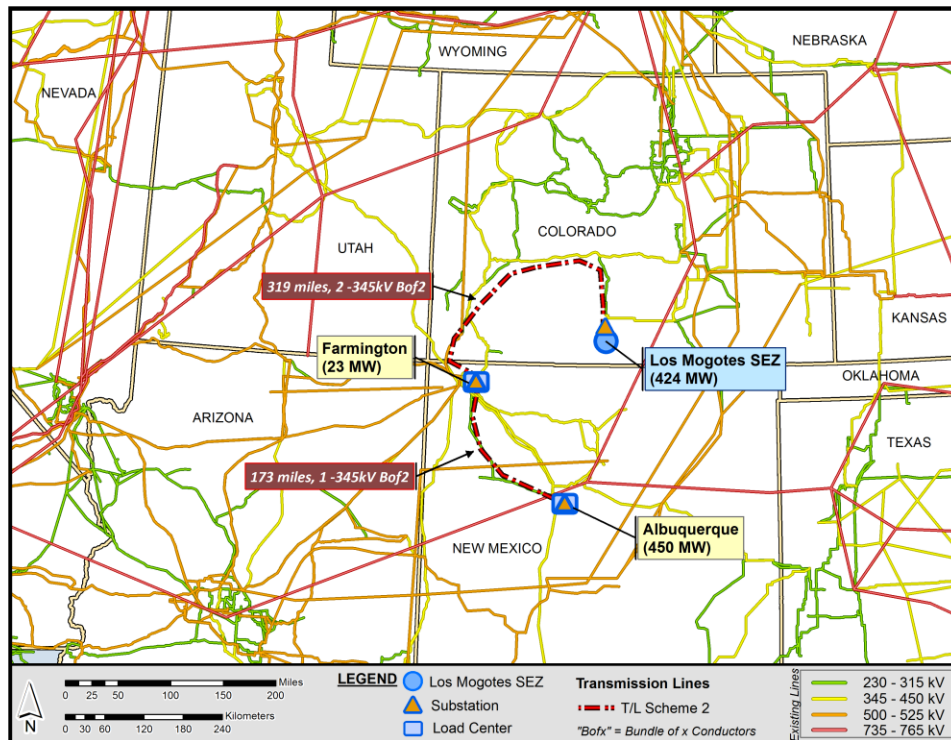

FIGURE 10.4.23.1-3 Transmission Scheme 2 for the Proposed Los Mogotes East SEZ (Source for background map: Platts 2011)

new transmission lines(s) would directly convey the 424-MW output of the Los Mogotes East SEZ to the prospective load areas for each possible transmission scheme. The approach also assumes that all existing transmission lines in the WECC region are saturated and have little or no available capacity to accommodate the SEZ’s output throughout the entire 10-year study horizon.

Figures 10.4.23.1-2 and 10.4.23.1-3 display the pathways that new dedicated lines might follow to distribute solar power generated at the Los Mogotes East SEZ via the two identified transmission schemes described in Table 10.4.23.1-1. These pathways parallel existing 500-, 345-, 230-kV, and lower voltage lines. The intent of following existing lines is to avoid pathways that may be infeasible due to topographical limitations or other concerns.

For transmission scheme 1, serving load centers to the north, a new line would be constructed to connect with Pueblo (52 MW), Colorado Springs (210 MW), and Denver (1,272 MW), so that the 424-MW output of the Los Mogotes East SEZ could be fully utilized (Figure 10.4.23.1-2). This particular scheme has three segments. The first segment extends northeast from the SEZ to Pueblo over a distance of about 138 mi (222 km). On the basis of engineering and operational considerations, this segment would require a single-circuit 345-kV bundle of two conductors (Bof2) transmission design. The second leg goes north about 43 mi (69 km) from Pueblo to Colorado Springs. The third and final leg extends 63 mi (101 km) farther north to Denver. The transmission configuration options were determined by using the line “loadability” curve in American Electric Power’s *Transmission Facts* (AEP 2010). Appendix G

1 **TABLE 10.4.23.1-1 Candidate Load Area Characteristics for the Proposed Los Mogotes**
 2 **East SEZ**

Transmission Scheme	City/Load Area Name	Position Relative to SEZ	2010 Population ^c	Estimated Total Peak Load (MW)	Estimated Peak Solar Market (MW)
1	Pueblo, Colorado ^a	North	104,877	262	52
	Colorado Springs, Colorado ^a	North	419,848	1,050	210
	Denver, Colorado ^b	North	2,543,000	6,358	1,272
2	Farmington, New Mexico ^a	Southwest	46,000	115	23
	Albuquerque, New Mexico ^b	South	907,775	2,269	450

^a The load area represents the city named.

^b The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

^c City and metropolitan area population data are from 2010 Census data (U.S. Bureau of the Census 2010).

3
4
5
6
7

documents the line options used for this analysis and describes how the load area groupings were determined.

8 For transmission scheme 2, serving load centers to the southwest, Figure 10.4.23.1-3
 9 shows that new lines would be constructed to connect with Farmington (23 MW) and
 10 Albuquerque (450 MW), so that the 424-MW output of the Los Mogotes East SEZ could be fully
 11 utilized. This scheme has two segments. The first segment, from the SEZ to Farmington, is
 12 319 mi (513 km) long, and the second segment, from Farmington to Albuquerque, is about
 13 173 mi (278 km) long. Again, the transmission configuration for each leg or segment varies and
 14 was determined by using the line “loadability” curve in American Electric Power’s *Transmission*
 15 *Facts* (AEP 2010), with the constraint that the full output of the SEZ (424 MW) would be
 16 completely marketed.

17
 18 Table 10.4.23.2-1 summarizes the distances to the various load areas over which new
 19 transmission lines would need to be constructed, as well as the assumed number of substations
 20 that would be required. One substation is assumed to be installed at each load area and an
 21 additional one at the SEZ. Thus, in general, the total number of substations per scheme is simply
 22 equal to the number of load areas associated with the scheme plus one. Substations at the load
 23 areas would consist of one or more step-down transformers, while the originating substation at
 24 the SEZ would consist of several step-up transformers. The originating substation would have a
 25 rating of at least 424 MW (to match the plant’s output), while the combined load substations
 26 would have a similar total rating of 424 MW. For schemes that require the branching of the lines,
 27 a switching substation is assumed to be constructed at the appropriate junction. In general,
 28 switching stations carry no local load but are assumed to be equipped with switching gears

29

1 **TABLE 10.4.23.2-1 Potential Transmission Schemes, Estimated Solar Markets, and Distances**
 2 **to Load Areas for the Proposed Los Mogotes SEZ**

Transmission Scheme	City/Load Area Name	Estimated Peak Solar Market (MW) ^c	Total Solar Market (MW)	Sequential Distance (mi) ^d	Total Distance (mi) ^d	Line Voltage (kV)	No. of Substations
1	Pueblo, Colorado ^a	52	1,534	138	244	345,	4
	Colorado Springs, Colorado ^a	210		43		138	
	Denver, Colorado ^b	1,272		63			
2	Farmington, New Mexico ^a	23	473	331	492	345	3
	Albuquerque, New Mexico ^b	450		173			

^a The load area represents the city named.

^b The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

^c From Table 10.4.23.1-1.

^d To convert mi to km, multiply by 1.6093.

3
4

5 (e.g., circuit breakers and connecting switches) to reroute power as well as, in some cases, with
 6 additional equipment to regulate voltage.

7

8 Table 10.4.23.2-2 provides an estimate of the total land area disturbed for construction
 9 of new transmission facilities under each of the schemes evaluated. The most favorable
 10 transmission scheme with respect to minimizing costs and the area disturbed would be scheme 1,
 11 which would serve the cities of Pueblo, Colorado Springs, and Denver and for which the
 12 construction of new transmission lines and substations is estimated to disturb about 4,460 acres
 13 (18 km²) of land. The less favorable transmission scheme with respect to minimizing costs and
 14 the area disturbed would be scheme 2 (serving Farmington and Albuquerque). For this scheme,
 15 the construction of new transmission lines and substations is estimated to disturb a land area on
 16 the order of 10,447 acres (42.3 km²).

17

18 Table 10.4.23.2-3 shows the estimated NPV of both transmission schemes and takes into
 19 account the cost of constructing the lines and the substations and the projected revenue stream
 20 over the 10-year horizon. A positive NPV indicates that revenues more than offset investments.
 21 This calculation does not include the cost of producing electricity.

22

23 The most economically attractive configuration (transmission scheme 1) has the highest
 24 positive NPV and serves the Colorado cities of Pueblo, Colorado Springs, and Denver. The
 25 secondary case (transmission scheme 2), which excludes one or more of the primary pathways
 26 used in scheme 1, is less economically attractive and focuses on delivering power to Farmington
 27 and Albuquerque. For the assumed utilization factor of 20%, scheme 2 exhibits a negative NPV,
 28 implying that this option may not be economically viable under the current assumptions.

29

30

1 **TABLE 10.4.23.2-2 Comparison of the Various Transmission Line Configurations with**
 2 **Respect to Land Use Requirements for the Proposed Los Mogotes East SEZ**

Transmission Scheme	City/Load Area Name	Total Distance (mi) ^c	No. of Substations	Land Use (acres) ^d		
				Transmission Line	Substation	Total
1	Pueblo, Colorado ^a Colorado Springs, Colorado ^a Denver, Colorado ^b	244	4	4,450.3	10.2	4,460.5
2	Farmington, New Mexico ^a Albuquerque, New Mexico ^b	492	3	10,436.4	10.2	10,446.6

^a The load area represents the city named.

^b The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

^c To convert mi to km, multiply by 1.6093.

^d To convert acres to km², multiply by 0.004047.

3
4
5 **TABLE 10.4.23.2-3 Comparison of Potential Transmission Lines with Respect to NPV (Base**
 6 **Case) for the Proposed Los Mogotes SEZ**

Transmission Scheme	City/Load Area Name	Present Value Transmission Line Cost (\$ million)	Present Value Substation Cost (\$ million)	Annual Sales Revenue (\$ million)	Present Worth of Revenue Stream (\$ million)	NPV (\$ million)
1	Pueblo, Colorado ^a Colorado Springs, Colorado ^a Denver, Colorado ^b	446.3	28.0	74.3	573.6	99.3
2	Farmington, New Mexico ^a Albuquerque, New Mexico ^b	1,178.1	28.0	74.3	573.8	-632.5

^a The load area represents the city named.

^b The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

7
8
9 Table 10.4.23.2-4 shows the effect of varying the value of the utilization factor on the
 10 NPV of the transmission schemes. The table shows that at about 50% utilization, NPVs for both
 11 schemes are positive. It also shows that as the utilization factor is increased, the economic
 12 viability of the lines also increases. Utilization factors can be raised by allowing the new
 13 dedicated lines to market other power generation outputs in the region in addition to that of its
 14 associated SEZ.

1 **TABLE 10.4.23.2-4 Effect of Varying the Utilization Factor on the NPV of the Transmission**
 2 **Schemes for the Proposed Los Mogotes East SEZ**

Transmission Scheme	City/Load Area Name	NPV (\$ million) at Different Utilization Factors					
		20%	30%	40%	50%	60%	70%
1	Pueblo, Colorado ^a Colorado Springs, Colorado ^a Denver, Colorado ^b	99.3	386.1	672.9	959.7	1,246.5	1,533.3
2	Farmington, New Mexico ^a Albuquerque, New Mexico ^b	-632.5	-345.7	-58.9	227.9	514.7	802.5

^a The load area represents the city named.

^b The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

3
4
5 The findings of the DLT analysis for the proposed Los Mogotes East SEZ are as follows:

- 6
7 • Transmission scheme 1, which identifies the cities of Pueblo, Colorado
8 Springs, and Denver (in that specific sequence) as the primary markets,
9 represents the most favorable option based on NPV and land use
10 requirements. This scheme would result in new land disturbance of about
11 4,460 acres (18 km²).
- 12
13 • Transmission scheme 2, which represents an alternative configuration, serves
14 Farmington and Albuquerque. In terms of defining potential upper-bound
15 impacts of new transmission infrastructure development, this configuration
16 would result in new land disturbance of about 10,447 acres (42.3 km²). In
17 terms of NPV, however, this scheme may not be economically viable under
18 the current assumptions.
- 19
20 • Other load area configurations are possible but would be less favorable than
21 scheme 1 in terms of NPV and, in most cases, also in terms of land use
22 requirements. If new electricity generation at the proposed Los Mogotes East
23 SEZ is not sent to either of the two markets identified above, the potential
24 upper-bound impacts in terms of cost would be greater.
- 25
26 • The analysis of transmission requirements for the proposed Los Mogotes East
27 SEZ would be expected to show lower costs and less land disturbance if solar-
28 eligible load assumptions were increased, although the magnitude of those
29 changes would vary due to a number of factors. In general, for cases such as
30 the Los Mogotes East SEZ that show multiple load areas being served to
31 accommodate the specified capacity, the estimated costs and land disturbance
32 would be affected by increasing the solar-eligible load assumption. By
33 increasing the eligible loads at all load areas, the transmission routing and

1 configuration solutions can take advantage of shorter line distances and
2 deliveries to fewer load areas, thus reducing costs and land disturbed. In
3 general, SEZs that show the greatest number of load areas served and greatest
4 distances required for new transmission lines (e.g., Riverside East) would
5 show the greatest decrease in impacts as a result of increasing the solar-
6 eligible load assumption from 20% to a higher percentage.
7
8

9 **10.4.24 Impacts of the Withdrawal**

10
11 The BLM proposes to withdraw 16,797 acres (67 km²) of public land comprising the
12 proposed Los Mogotes East SEZ from settlement, sale, location, or entry under the general land
13 laws, including the mining laws, for a period of 20 years (see Section 2.2.2.2.4 of the Final Solar
14 PEIS). The public lands would be withdrawn, subject to valid existing rights, from settlement,
15 sale, location, or entry under the general land laws, including the mining laws. This means that
16 the lands could not be appropriated, sold, or exchanged during the term of the withdrawal, and
17 new mining claims could not be filed on the withdrawn lands. Mining claims filed prior to the
18 segregation or withdrawal of the identified lands would take precedence over future solar energy
19 development. The withdrawn lands would remain open to the mineral leasing, geothermal
20 leasing, and mineral material laws, and the BLM could elect to lease the oil, gas, coal, or
21 geothermal steam resources, or to sell common variety-mineral materials, such as sand and
22 gravel, contained in the withdrawn lands. In addition, the BLM would retain the discretion to
23 authorize linear and renewable energy ROWs on the withdrawn lands.
24

25 The purpose of the proposed land withdrawal is to minimize the potential for conflicts
26 between mineral development and solar energy development for the proposed 20-year
27 withdrawal period. Under the land withdrawal, there would be no mining-related surface
28 development, such as the establishment of open pit mining, construction of roads for hauling
29 materials, extraction of ores from tunnels or adits, or construction of facilities to process the
30 material mined, that could preclude use of the SEZ for solar energy development. For the
31 Los Mogotes East SEZ, the impacts of the proposed withdrawal on mineral resources and related
32 economic activity and employment are expected to be negligible because the mineral potential of
33 the lands within the SEZ is low (BLM 2012). There has been no documented mining within the
34 SEZ, and there are no known locatable mineral deposits within the land withdrawal area.
35 According to the LR2000 (accessed in January 2012), there are no recorded mining claims
36 within the land withdrawal area.
37

38 Although the mineral potential of the lands within the Los Mogotes East SEZ is low, the
39 proposed withdrawal of lands within the SEZ would preclude many types of mining activity over
40 a 20-year period, resulting in the avoidance of potential mining related adverse impacts. Impacts
41 commonly related to mining development include increased soil erosion and sedimentation,
42 water use, generation of contaminated water in need of treatment, creation of lagoons and ponds
43 (hazardous to wildlife), toxic runoff, air pollution, establishment of noxious weeds and invasive
44 species, habitat destruction or fragmentation, disturbance of wildlife, blockage of migration
45 corridors, increased visual contrast, noise, destruction of cultural artifacts and fossils and/or their

1 context, disruption of landscapes and sacred places of interest to tribes, increased traffic and
2 related emissions, and conflicts with other land uses (e.g., recreational).

1 **10.4.26 Errata for the Proposed Los Mogotes East SEZ**
2

3 This section presents corrections to material presented in the Draft Solar PEIS and the
4 Supplement to the Draft. The need for these corrections was identified in several ways: through
5 comments received on the Draft Solar PEIS and the Supplement to the Draft (and verified by the
6 authors), through new information obtained by the authors subsequent to publication of the Draft
7 Solar PEIS and the Supplement to the Draft, or through additional review of the original material
8 by the authors. Table 10.4.26-1 provides corrections to information presented in the Draft Solar
9 PEIS and the Supplement to the Draft.
10
11

TABLE 10.4.26-1 Errata for the Proposed Los Mogotes East SEZ (Section 10.1.4 of the Draft Solar PEIS and Section C.3.4 of the Supplement to the Draft Solar PEIS)

Section No.	Page No.	Line No.	Figure No.	Table No.	Correction
10.4.1.2	10.4-3	24–25			“The nearest existing transmission line is a 69-kV line adjacent to the SEZ,” should read, “The nearest existing transmission line is a 69-kV line located about 3 mi (5 km) to the east of the SEZ.”
10.4.5.1	10.4-31	10			The text indicates that quail are hunted in the area. The Colorado Division of Wildlife has commented that quail are not found in this area.
10.4.11.2					All uses of the term “neotropical migrants” in the text and tables of this section should be replaced with the term “passerines.”
10.4.14.2	10.4-225	28–29	10.4.14.2-9		The text reads “The West Fork is visible as a blue dashed line near the eastern boundary of the SEZ on Figure 10.4.14.2-9.” This line did not appear in the figure. This information is shown correctly in Figure 10.4.14.2-2 of this Final Solar PEIS.
