

NOTATION

The following is a list of acronyms and abbreviations, chemical names, and units of measure used in this document. Some acronyms used only in tables may be defined only in those tables.

GENERAL ACRONYMS AND ABBREVIATIONS

10	AADT	annual average daily traffic
11	AASHTO	American Association of State Highway and Transportation Officials
12	AC	alternating current
13	ACC	air-cooled condenser
14	ACEC	Area of Critical Environmental Concern
15	ADEQ	Arizona Department of Environmental Quality
16	ACHP	Advisory Council on Historic Preservation
17	ADOT	Arizona Department of Transportation
18	ADWR	Arizona Department of Water Resources
19	AERMOD	AMS/EPA Regulatory Model
20	AFC	Application for Certification
21	AGL	above ground level
22	AIM	Assessment, Inventory and Monitoring
23	AIRFA	American Indian Religious Freedom Act
24	AMA	active management area
25	AML	animal management level
26	ANHP	Arizona National Heritage Program
27	APE	area of potential effect
28	APLIC	Avian Power Line Interaction Committee
29	APP	Avian Protection Plan
30	APS	Arizona Public Service
31	AQCR	Air Quality Control Region
32	AQRV	air quality-related value
33	ARB	Air Resources Board
34	ARRA	American Recovery and Reinvestment Act of 2009
35	ARRTIS	Arizona Renewable Resource and Transmission Identification Subcommittee
36	ARS	Agricultural Research Service
37	ARZC	Arizona and California
38	ATSDR	Agency for Toxic Substances and Disease Registry
39	AUM	animal unit month
40	AVSE	Arlington Valley Solar Energy
41	AVWS	Audio Visual Warning System
42	AWBA	Arizona Water Banking Authority
43	AWEA	American Wind Energy Association
44	AWRM	Active Water Resource Management
45	AZDA	Arizona Department of Agriculture
46	AZGFD	Arizona Game and Fish Department

1	AZGS	Arizona Geological Survey
2		
3	BA	biological assessment
4	BAP	base annual production
5	BEA	Bureau of Economic Analysis
6	BISON-M	Biota Information System of New Mexico
7	BLM	Bureau of Land Management
8	BLM-CA	Bureau of Land Management, California
9	BMP	best management practice
10	BNSF	Burlington Northern Santa Fe
11	BO	biological opinion
12	BOR	U.S. Bureau of Reclamation
13	BPA	Bonneville Power Administration
14	BRAC	Blue Ribbon Advisory Council on Climate Change
15	BSE	Beacon Solar Energy
16	BSEP	Beacon Solar Energy Project
17	BTS	Bureau of Transportation Statistics
18		
19	CAA	Clean Air Act
20	CAAQS	California Air Quality Standards
21	CAISO	California Independent System Operator
22	Caltrans	California Department of Transportation
23	C-AMA	California-Arizona Maneuver Area
24	CAP	Central Arizona Project
25	CARB	California Air Resources Board
26	CAReGAP	California Regional Gap Analysis Project
27	CASQA	California Stormwater Quality Association
28	CASTNET	Clean Air Status and Trends NETwork
29	CAWA	Colorado Agricultural Water Alliance
30	CCC	Civilian Conservation Corps
31	CDC	Centers for Disease Control and Prevention
32	CDCA	California Desert Conservation Area
33	CDFG	California Department of Fish and Game
34	CDNCA	California Desert National Conservation Area
35	CDOT	Colorado Department of Transportation
36	CDOW	Colorado Division of Wildlife (now Colorado Parks and Wildlife)
37	CDPHE	Colorado Department of Public Health and Environment
38	CDWR	California Department of Water Resources
39	CEC	California Energy Commission
40	CEQ	Council on Environmental Quality
41	CES	constant elasticity of substitution
42	CESA	California Endangered Species Act
43	CESF	Carrizo Energy Solar Farm
44	CFR	<i>Code of Federal Regulations</i>
45	CGE	computable general equilibrium
46	CHAT	crucial habitat assessment tool

1	CIRA	Cooperative Institute for Research in the Atmosphere
2	CLFR	compact linear Fresnel reflector
3	CNDDDB	California Natural Diversity Database
4	CNEL	community noise equivalent level
5	CNHP	Colorado National Heritage Program
6	Colorado DWR	Colorado Division of Water Resources
7	CO ₂ e	carbon dioxide equivalent
8	CPC	Center for Plant Conservation
9	CPUC	California Public Utilities Commission
10	CPV	concentrating photovoltaic
11	CRBSCF	Colorado River Basin Salinity Control Forum
12	CREZ	competitive renewable energy zone
13	CRPC	Cultural Resources Preservation Council
14	CRSCP	Colorado River Salinity Control Program
15	CSA	Candidate Study Area
16	CSC	Coastal Services Center
17	CSFG	carbon-sequestration fossil generation
18	CSP	concentrating solar power
19	CSQA	California Stormwater Quality Association
20	CSRI	Cultural Systems Research, Incorporated
21	CTG	combustion turbine generator
22	CTPG	California Transmission Planning Group
23	CTSR	Cumbres & Toltec Scenic Railroad
24	CUP	Conditional Use Permit
25	CVP	Central Valley Project
26	CWA	Clean Water Act
27	CWCB	Colorado Water Conservation Board
28	CWHR	California Wildlife Habitat Relationship System
29		
30	DC	direct current
31	DEM	digital elevation model
32	DHS	U.S. Department of Homeland Security
33	DIMA	Database for Inventory, Monitoring and Assessment
34	DLT	dedicated-line transmission
35	DNA	Determination of NEPA Adequacy
36	DNI	direct normal insulation
37	DNL	day-night average sound level
38	DoD	U.S. Department of Defense
39	DOE	U.S. Department of Energy
40	DOI	U.S. Department of the Interior
41	DOL	U.S. Department of Labor
42	DOT	U.S. Department of Transportation
43	DRECP	California Desert Renewable Energy Conservation Plan
44	DSM	demand-side management
45	DSRP	Decommissioning and Site Reclamation Plan
46	DTC/C-AMA	Desert Training Center/California–Arizona Maneuver Area

1	DWMA	Desert Wildlife Management Area
2	DWR	Division of Water Resources
3		
4	EA	environmental assessment
5	EBID	Elephant Butte Irrigation District
6	ECAR	East Central Area Reliability Coordination Agreement
7	ECOS	Environmental Conservation Online System (USFWS)
8	EERE	Energy Efficiency and Renewable Energy (DOE)
9	Eg	band gap energy
10	EIA	Energy Information Administration (DOE)
11	EIS	environmental impact statement
12	EISA	Energy Independence and Security Act of 2007
13	EMF	electromagnetic field
14	E.O.	Executive Order
15	EPA	U.S. Environmental Protection Agency
16	EPRI	Electric Power Research Institute
17	EQIP	Environmental Quality Incentives Program
18	ERCOT	Electric Reliability Council of Texas
19	ERO	Electric Reliability Organization
20	ERS	Economic Research Service
21	ESA	Endangered Species Act of 1973
22	ESRI	Environmental Systems Research Institute
23		
24	FAA	Federal Aviation Administration
25	FBI	Federal Bureau of Investigation
26	FEMA	Federal Emergency Management Agency
27	FERC	Federal Energy Regulatory Commission
28	FHWA	Federal Highway Administration
29	FIRM	Flood Insurance Rate Map
30	FLPMA	Federal Land Policy and Management Act of 1976
31	FONSI	Finding of No Significant Impact
32	FR	<i>Federal Register</i>
33	FRCC	Florida Reliability Coordinating Council
34	FSA	Final Staff Assessment
35	FTE	full-time equivalent
36	FY	fiscal year
37		
38	G&TM	generation and transmission modeling
39	GCRP	U.S. Global Climate Research Program
40	GDA	generation development area
41	GHG	greenhouse gas
42	GIS	geographic information system
43	GMU	game management unit
44	GPS	global positioning system
45	GTM	Generation and Transmission Model
46		

1	GUAC	Groundwater Users Advisory Council
2	GWP	global warming potential
3		
4	HA	herd area
5	HAP	hazardous air pollutant
6	HAZCOM	hazard communication
7	HCE	heat collection element
8	HCP	Habitat Conservation Plan
9	HMA	herd management area
10	HMMH	Harris Miller Miller & Hanson, Inc.
11	HRSG	heat recovery steam generator
12	HSPD	Homeland Security Presidential Directive
13	HTF	heat transfer fluid
14	HUC	hydrologic unit code
15	HVAC	heating, ventilation, and air-conditioning
16		
17	I	Interstate
18	IARC	International Agency for Research on Cancer
19	IBA	important bird area
20	ICE	internal combustion engine
21	ICPDS	Imperial County Planning & Development Services
22	ICWMA	Imperial County Weed Management Area
23	IDT	interdisciplinary team
24	IEC	International Electrochemical Commission
25	IFR	instrument flight rule
26	IID	Imperial Irrigation District
27	IM	Instruction Memorandum
28	IMPS	Iron Mountain Pumping Station
29	IMS	interim mitigation strategy
30	INA	Irrigation Non-Expansion Area
31	IOP	Interagency Operating Procedure
32	IOU	investor-owned utility
33	IPCC	Intergovernmental Panel on Climate Change
34	ISA	Independent Science Advisor; Instant Study Area
35	ISB	Intermontane Seismic Belt
36	ISCC	integrated solar combined cycle
37	ISDRA	Imperial Sand Dunes Recreation Area
38	ISEGS	Ivanpah Solar Energy Generating System
39	ISO	independent system operator; iterative self-organizing
40	ITFR	Interim Temporary Final Rulemaking
41	ITP	incidental take permit
42	IUCNNR	International Union for Conservation of Nature and Natural Resources
43	IUCNP	International Union for Conservation of Nature Pakistan
44		
45	KGA	known geothermal resources area
46	KML	keyhole markup language

1	KOP	key observation point
2	KSLA	known sodium leasing area
3		
4	LCC	Landscape Conservation Cooperative
5	LCCRDA	Lincoln County Conservation, Recreation, and Development Act of 2004
6	LCOE	levelized cost of energy
7	L _{dn}	day-night average sound level
8	LDWMA	Low Desert Weed Management Area
9	L _{eq}	equivalent sound pressure level
10	LiDAR	light detection and ranging
11	LLA	limited land available
12	LLRW	low-level radioactive waste (waste classification)
13	LPN	listing priority number
14	LRG	Lower Rio Grande
15	LSA	lake and streambed alteration
16	LSE	load-serving entity
17	LTMP	long-term monitoring and adaptive management plan
18	LTVA	long-term visitor area
19		
20	MAAC	Mid-Atlantic Area Council
21	MAIN	Mid-Atlantic Interconnected Network
22	MAPP	methyl acetylene propadiene stabilizer; Mid-Continent Area Power Pool
23	MCAS	Marine Corps Air Station
24	MCL	maximum contaminant level
25	MEB	Marine Expeditionary Brigade
26	MFP	Management Framework Plan
27	MIG	Minnesota IMPLAN Group
28	MLA	maximum land available
29	MOA	military operating area
30	MOU	Memorandum of Understanding
31	MPDS	maximum potential development scenario
32	MRA	Multiple Resource Area
33	MRI	Midwest Research Institute
34	MRO	Midwest Reliability Organization
35	MSDS	Material Safety Data Sheet
36	MSL	mean sea level
37	MTR	military training route
38	MVEDA	Mesilla Valley Economic Development Alliance
39	MWA	Mojave Water Agency
40	MWD	Metropolitan Water District
41	MWMA	Mojave Weed Management Area
42	NAAQS	National Ambient Air Quality Standard(s)
43	NADP	National Atmospheric Deposition Program
44	NAGPRA	Native American Graves Protection and Repatriation Act
45	NAHC	Native American Heritage Commission (California)
46	NAIC	North American Industrial Classification System

1	NASA	National Aeronautics and Space Administration
2	NCA	National Conservation Area
3	NCCAC	Nevada Climate Change Advisory Committee
4	NCDC	National Climatic Data Center
5	NCES	National Center for Education Statistics
6	NDAA	National Defense Authorization Act
7	NDCNR	Nevada Department of Conservation and Natural Resources
8	NDEP	Nevada Division of Environmental Protection
9	NDOT	Nevada Department of Transportation
10	NDOW	Nevada Department of Wildlife
11	NDWP	Nevada Division of Water Planning
12	NDWR	Nevada Division of Water Resources
13	NEAP	Natural Events Action Plan
14	NEC	National Electric Code
15	NED	National Elevation Database
16	NEP	Natural Events Policy
17	NEPA	National Environmental Policy Act of 1969
18	NERC	North American Electricity Reliability Corporation
19	NGO	non-governmental organization
20	NHA	National Heritage Area
21	NHD	National Hydrography Dataset
22	NHNM	National Heritage New Mexico
23	NHPA	National Historic Preservation Act of 1966
24	NID	National Inventory of Dams
25	NLCS	National Landscape Conservation System
26	NMAC	<i>New Mexico Administrative Code</i>
27	NMBGMR	New Mexico Bureau of Geology and Mineral Resources
28	NMDGF	New Mexico Department of Game and Fish
29	NM DOT	New Mexico Department of Transportation
30	NMED	New Mexico Environment Department
31	NMED-AQB	New Mexico Environment Department-Air Quality Board
32	NMFS	National Marine Fisheries Service
33	NMOSE	New Mexico Office of the State Engineer
34	NMSU	New Mexico State University
35	NNHP	Nevada Natural Heritage Program
36	NNL	National Natural Landmark
37	NNSA	National Nuclear Security Administration
38	NOA	Notice of Availability
39	NOAA	National Oceanic and Atmospheric Administration
40	NOI	Notice of Intent
41	NP	National Park
42	NPDES	National Pollutant Discharge Elimination System
43	NPL	National Priorities List
44	NPS	National Park Service
45	NPV	net present value
46	NRA	National Recreation Area

1	NRCS	Natural Resources Conservation Service
2	NREL	National Renewable Energy Laboratory
3	NRHP	<i>National Register of Historic Places</i>
4	NRS	<i>Nevada Revised Statutes</i>
5	NSC	National Safety Council
6	NSO	no surface occupancy
7	NSTC	National Science and Technology Council
8	NTHP	National Trust for Historic Preservation
9	NTS	Nevada Test Site
10	NTTR	Nevada Test and Training Range
11	NVCRS	Nevada Cultural Resources Inventory System
12	NV DOT	Nevada Department of Transportation
13	NWCC	National Wind Coordinating Committee
14	NWI	National Wetlands Inventory
15	NWIS	National Water Information System (USGS)
16	NWPP	Northwest Power Pool
17	NWR	National Wildlife Refuge
18	NWSRS	National Wild and Scenic River System
19		
20	O&M	operation and maintenance
21	ODFW	Oregon Department of Fish and Wildlife
22	OHV	off-highway vehicle
23	ONA	Outstanding Natural Area
24	ORC	organic Rankine cycle
25	OSE/ISC	Office of the State Engineer/Interstate Stream Commission
26	OSHA	Occupational Safety and Health Administration
27	OTA	Office of Technology Assessment
28		
29	PA	Programmatic Agreement
30	PAD	Preliminary Application Document
31	PAH	polycyclic aromatic hydrocarbon
32	PAT	peer analysis tool
33	PCB	polychlorinated biphenyl
34	PCM	purchase change material
35	PCS	power conditioning system
36	PCU	power converting unit
37	PEIS	programmatic environmental impact statement
38	PFYC	potential fossil yield classification
39	PGH	Preliminary General Habitat
40	PIER	Public Interest Energy Research
41	P.L.	Public Law
42	PLSS	Public Land Survey System
43	PM	particulate matter
44	PM _{2.5}	particulate matter with a diameter of 2.5 µm or less
45	PM ₁₀	particulate matter with a diameter of 10 µm or less
46	PPA	Power Purchase Agreement

1	P-P-D	population-to-power density
2	PPH	Preliminary Priority Habitat
3	POD	plan of development
4	POU	publicly owned utility
5	PPA	Power Purchase Agreement
6	PPE	personal protective equipment
7	PSD	Prevention of Significant Deterioration
8	PURPA	Public Utility Regulatory Policy Act
9	PV	photovoltaic
10	PVID	Palo Verde Irrigation District
11	PWR	public water reserve
12		
13	QRA	qualified resource area
14		
15	R&I	relevance and importance
16	RAC	Resource Advisory Council
17	RCE	Reclamation Cost Estimate
18	RCI	residential, commercial, and industrial (sector)
19	RCRA	Resource Conservation and Recovery Act of 1976
20	RD&D	research, development, and demonstration; research, development, and
21		deployment
22	RDBMS	Relational Database Management System
23	RDEP	Restoration Design Energy Project
24	REA	Rapid Ecoregional Assessment
25	REAT	Renewable Energy Action Team
26	REDA	Renewable Energy Development Area
27	REDI	Renewable Energy Development Infrastructure
28	REEA	Renewable Energy Evaluation Area
29	ReEDS	Regional Energy Deployment System
30	REPG	Renewable Energy Policy Group
31	RETA	Renewable Energy Transmission Authority
32	RETAAC	Renewable Energy Transmission Access Advisory Committee
33	RETI	Renewable Energy Transmission Initiative
34	REZ	renewable energy zone
35	RF	radio frequency
36	RFC	Reliability First Corporation
37	RFDS	reasonably foreseeable development scenario
38	RGP	Rio Grande Project
39	RGWCD	Rio Grande Water Conservation District
40	RMP	Resource Management Plan
41	RMPA	Rocky Mountain Power Area
42	RMZ	Resource Management Zone
43	ROD	Record of Decision
44	ROI	region of influence
45	ROS	recreation opportunity spectrum
46	ROW	right-of-way

1	RPG	renewable portfolio goal
2	RPS	Renewable Portfolio Standard
3	RRC	Regional Reliability Council
4	RSEP	Rice Solar Energy Project
5	RSI	Renewable Systems Interconnection
6	RTO	regional transmission organization
7	RTTF	Renewable Transmission Task Force
8	RV	recreational vehicle
9		
10	SAAQS	State Ambient Air Quality Standard(s)
11	SAMHSA	Substance Abuse and Mental Health Services Administration
12	SCADA	supervisory control and data acquisition
13	SCE	Southern California Edison
14	SCRMA	Special Cultural Resource Management Area
15	SDRREG	San Diego Regional Renewable Energy Group
16	SDWA	Safe Drinking Water Act of 1974
17	SEGIS	Solar Energy Grid Integration System
18	SEGS	Solar Energy Generating System
19	SEI	Sustainable Energy Ireland
20	SEIA	Solar Energy Industrial Association
21	SES	Stirling Energy Systems
22	SETP	Solar Energy Technologies Program (DOE)
23	SEZ	solar energy zone
24	SHPO	State Historic Preservation Office(r)
25	SIP	State Implementation Plan
26	SLRG	San Luis & Rio Grande
27	SMA	Special Management Area
28	SMART	specific, measurable, achievable, relevant, and time sensitive
29	SMP	suggested management practice
30	SNWA	Southern Nevada Water Authority
31	SPP	Southwest Power Pool
32	SRMA	Special Recreation Management Area
33	SSA	Socorro Seismic Anomaly
34	SSI	self-supplied industry
35	ST	solar thermal
36	STG	steam turbine generator
37	SUA	special use airspace
38	SWAT	Southwest Area Transmission
39	SWIP	Southwest Intertie Project
40	SWPPP	Stormwater Pollution Prevention Plan
41	SWReGAP	Southwest Regional Gap Analysis Project
42		
43	TAP	toxic air pollutant
44	TCC	Transmission Corridor Committee
45	TDS	total dissolved solids
46	TEPPC	Transmission Expansion Planning Policy Committee

1	TES	thermal energy storage
2	TRACE	Transmission Routing and Configuration Estimator
3	TSA	Transportation Security Administration
4	TSCA	Toxic Substances Control Act of 1976
5	TSDF	treatment, storage, and disposal facility
6	TSP	total suspended particulates
7		
8	UACD	Utah Association of Conservation Districts
9	UBWR	Utah Board of Water Resources
10	UDA	Utah Department of Agriculture
11	UDEQ	Utah Department of Environmental Quality
12	UDNR	Utah Department of Natural Resources
13	UDOT	Utah Department of Transportation
14	UDWQ	Utah Division of Water Quality
15	UDWR	Utah Division of Wildlife Resources
16	UGS	Utah Geological Survey
17	UNEP	United Nations Environmental Programme
18	UNPS	Utah Native Plant Society
19	UP	Union Pacific
20	UREZ	Utah Renewable Energy Zone
21	USACE	U.S. Army Corps of Engineers
22	USAF	U.S. Air Force
23	USC	<i>United States Code</i>
24	USDA	U.S. Department of Agriculture
25	USFS	U.S. Forest Service
26	USFWS	U.S. Fish and Wildlife Service
27	USGS	U.S. Geological Survey
28	Utah DWR	Utah Division of Water Rights
29	UTTR	Utah Test and Training Range
30	UWS	Underground Water Storage, Savings and Replenishment Act
31		
32	VACAR	Virginia–Carolinas Subregion
33	VCRS	Visual Contrast Rating System
34	VFR	visual flight rule
35	VOC	volatile organic compound
36	VRHCRP	Virgin River Habitat Conservation & Recovery Program
37	VRI	Visual Resource Inventory
38	VRM	Visual Resource Management
39		
40	WA	Wilderness Area
41	WECC	Western Electricity Coordinating Council
42	WECC CAN	Western Electricity Coordinating Council–Canada
43	WEG	wind erodibility group
44	Western	Western Area Power Administration
45	WGA	Western Governors’ Association
46	WGFD	Wyoming Game and Fish Department

1	WHA	wildlife habitat area
2	WHO	World Health Organization
3	WIA	Wyoming Infrastructure Authority
4	WRAP	Water Resources Allocation Program; Western Regional Air Partnership
5	WRCC	Western Regional Climate Center
6	WREZ	Western Renewable Energy Zones
7	WRI	Water Resources Research Institute
8	WSA	Wilderness Study Area
9	WSC	wildlife species of special concern
10	WSMR	White Sands Missile Range
11	WSR	Wild and Scenic River
12	WSRA	Wild and Scenic Rivers Act of 1968
13	WWII	World War II
14	WWP	Western Watersheds Project
15		
16	YPG	Yuma Proving Ground
17		
18	ZITA	zone identification and technical analysis
19	ZLD	zero liquid discharge

20
21

22 **CHEMICALS**

23				
24	CH ₄	methane	NO ₂	nitrogen dioxide
25	CO	carbon monoxide	NO _x	nitrogen oxides
26	CO ₂	carbon dioxide		
27			O ₃	ozone
28	H ₂ S	hydrogen sulfide		
29	Hg	mercury	Pb	lead
30				
31	N ₂ O	nitrous oxide	SF ₆	sulfur hexafluoride
32	NH ₃	ammonia	SO ₂	sulfur dioxide
			SO _x	sulfur oxides

33
34

35 **UNITS OF MEASURE**

36				
37	ac-ft	acre-foot (feet)	dB	A-weighted decibel(s)
38	bhp	brake horsepower		
39			°F	degree(s) Fahrenheit
40	°C	degree(s) Celsius	ft	foot (feet)
41	cf	cubic foot (feet)	ft ²	square foot (feet)
42	cfs	cubic foot (feet) per second	ft ³	cubic foot (feet)
43	cm	centimeter(s)		
44			g	gram(s)
45	dB	decibel(s)	gal	gallon(s)

1	GJ	gigajoule(s)	MWe	megawatt(s) electric
2	gpcd	gallon per capita per day	MWh	megawatt-hour(s)
3	gpd	gallon(s) per day		
4	gpm	gallon(s) per minute	ppm	part(s) per million
5	GW	gigawatt(s)	psi	pound(s) per square inch
6	GWh	gigawatt hour(s)	psia	pound(s) per square inch absolute
7	GWh/yr	gigawatt hour(s) per year		
8			rpm	rotation(s) per minute
9	h	hour(s)		
10	ha	hectare(s)	s	second(s)
11	Hz	hertz	scf	standard cubic foot (feet)
12				
13	in.	inch(es)	TWh	terawatt hour(s)
14				
15	J	joule(s)	VdB	vibration velocity decibel(s)
16				
17	K	degree(s) Kelvin	W	watt(s)
18	kcal	kilocalorie(s)		
19	kg	kilogram(s)	yd ²	square yard(s)
20	kHz	kilohertz	yd ³	cubic yard(s)
21	km	kilometer(s)	yr	year(s)
22	km ²	square kilometer(s)		
23	kPa	kilopascal(s)	µg	microgram(s)
24	kV	kilovolt(s)	µm	micrometer(s)
25	kVA	kilovolt-ampere(s)		
26	kW	kilowatt(s)		
27	kWh	kilowatt-hour(s)		
28	kWp	kilowatt peak		
29				
30	L	liter(s)		
31	lb	pound(s)		
32				
33	m	meter(s)		
34	m ²	square meter(s)		
35	m ³	cubic meter(s)		
36	mg	milligram(s)		
37	Mgal	million gallons		
38	mi	mile(s)		
39	mi ²	square mile(s)		
40	min	minute(s)		
41	mm	millimeter(s)		
42	MMt	million metric ton(s)		
43	MPa	megapascal(s)		
44	mph	mile(s) per hour		
45	MVA	megavolt-ampere(s)		
46	MW	megawatt(s)		

1 **13 UPDATE TO AFFECTED ENVIRONMENT AND IMPACT ASSESSMENT FOR**
2 **PROPOSED SOLAR ENERGY ZONES IN UTAH**
3
4

5 The U.S. Department of the Interior Bureau of Land Management (BLM) has
6 carried 17 solar energy zones (SEZs) forward for analysis in this Final Solar Programmatic
7 Environmental Impact Statement (PEIS). These SEZs total approximately 285,000 acres
8 (1,153 km²) of land potentially available for development. This chapter includes analyses of
9 potential environmental impacts for the proposed SEZs in Utah. The SEZ-specific analyses
10 provide documentation from which the BLM will tier future project authorizations, thereby
11 limiting the required scope and effort of project-specific National Environmental Policy Act of
12 1969 (NEPA) analyses.
13

14 The BLM is committed to collecting additional SEZ-specific resource data and
15 conducting additional analysis in order to more efficiently facilitate future development in
16 SEZs. The BLM developed action plans for each of the 17 SEZs carried forward as part of the
17 Supplement to the Draft Solar PEIS (BLM and DOE 2011). These action plans described
18 additional data that could be collected for individual SEZs and proposed data sources and
19 methods for the collection of those data. Work is under way to collect additional data as
20 specified under these action plans (e.g., additional data collection to support evaluation of
21 cultural, visual, and water resources has begun). As the data become available, they will be
22 posted on the project Web site (<http://solareis.anl.gov>) for use by applicants and the BLM and
23 other agency staff.
24

25 To accommodate the flexibility described in the BLM's program objectives and in light
26 of anticipated changes in technologies and environmental conditions over time, the BLM has
27 removed some of the prescriptive SEZ-specific design features presented in the Draft Solar PEIS
28 (BLM and DOE 2010) and the Supplement to the Draft (e.g., height restrictions on technologies
29 used to address visual resource impacts). Alternatively, the BLM will give full consideration to
30 any outstanding conflicts in SEZs as part of the competitive process being developed through
31 rulemaking (see Section 2.2.2.2.1).
32

33 In preparing selected parcels for competitive offer, the BLM will review all existing
34 analysis for an SEZ and consider any new or changed circumstances that may affect the
35 development of the SEZ. The BLM will also work with appropriate federal, state, and local
36 agencies, and affected tribes, as necessary, to discuss SEZ-related issues. This work would
37 ultimately inform how a affected parcel would be offered competitively (e.g., parcel size and
38 configuration, technology limitations, mitigation requirements, and parcel-specific competitive
39 process). Prior to issuing a notice of competitive offer, the BLM would complete appropriate
40 NEPA analysis to support the offer. This analysis would tier to the analysis for SEZs in the Solar
41 PEIS to the extent practicable.
42

43 It is the BLM's goal to compile all data, information, and analyses for SEZs from the
44 Draft Solar PEIS, the Supplement to the Draft, and this Final PEIS into a single location
45 accessible via the project Web site (<http://solareis.anl.gov>) for ease of use by applicants and the
46 BLM and other agency staff.

1 This chapter is an update to the information on Utah SEZs presented in the Draft Solar
2 PEIS. The information presented supplements and updates, but does not replace, the information
3 provided in the corresponding Chapter 13 on proposed SEZs in Utah in the Draft Solar PEIS.
4 Corrections to incorrect information in Sections 13.1, 13.2, and 13.3 of the Draft Solar PEIS
5 and in Sections C.6.1, C.6.2, and C.6.3 of the Supplement to the Draft are provided in
6 Sections 13.1.26, 13.2.26, and 13.3.26 of this Final Solar PEIS.

1 **13.3 WAH WAH VALLEY**

2
3
4 **13.3.1 Background and Summary of Impacts**

5
6
7 **13.3.1.1 General Information**

8
9 The proposed Wah Wah Valley SEZ is located in Beaver County in southwestern Utah
10 about 21 mi (34 km) northwest of the proposed Milford Flats South SEZ. In 2008, the county
11 population was 7,265, while adjacent Iron County to the south had a population of 45,833. The
12 largest nearby town is Cedar City, Utah, about 50 mi (80 km) southeast in Iron County. The town
13 of Milford is located about 23 mi (37 km) east.

14
15 The SEZ can be accessed from State Route 21, which runs from west to east through the
16 northern half of the SEZ. Access to the interior of the SEZ is by dirt roads. The nearest UP
17 Railroad stop is 23 mi (37 km) away in Milford. As of October 28, 2011, there were no pending
18 ROW applications for solar projects within the SEZ.

19
20 As published in the Draft Solar PEIS (BLM and DOE 2010), the proposed Wah Wah
21 Valley SEZ had a total area of 6,097 acres (25 km²) (see Figure 13.3.1.1-1). In the Supplement
22 to the Draft Solar PEIS (BLM and DOE 2011), no boundary revisions were identified for the
23 proposed SEZ. However, areas specified for non-development were mapped, where data were
24 available. For the proposed Wah Wah Valley SEZ, 224 acres (0.91 km²) of the Wah Wah Wash
25 was identified as a non-development area (see Figure 13.3.1.1-2). The remaining developable
26 area within the SEZ is 5,873 acres (23.8 km²).

27
28 The analyses in the following sections update the affected environment and potential
29 environmental, cultural, and socioeconomic impacts associated with utility-scale solar energy
30 development in the Wah Wah Valley SEZ as described in the Draft Solar PEIS.

31
32
33 **13.3.1.2 Development Assumptions for the Impact Analysis**

34
35 Maximum solar development of the Wah Wah Valley SEZ was assumed to be 80% of
36 the developable SEZ area over a period of 20 years, a maximum of 4,698 acres (19 km²). Full
37 development of the Wah Wah Valley SEZ would allow development of facilities with an
38 estimated total of between 522 MW (power tower, dish engine, or PV technologies, 9 acres/MW
39 [0.04 km²/MW]) and 940 MW (solar trough technologies, 5 acres/MW [0.02 km²/MW]) of
40 electrical power capacity (Table 13.3.1.2-1).

41
42 Availability of transmission from SEZs to load centers will be an important consideration
43 for future development in SEZs. For the proposed Wah Wah Valley SEZ, the nearest existing
44 transmission line as identified in the Draft Solar PEIS is a 138-kV line 42 mi (68 km) east of the
45 SEZ. It is possible that a new transmission line could be constructed from the SEZ to this
46 existing line, but the capacity of the line would be inadequate for the possible 522 to 940 MW

1

2 **FIGURE 13.3.1.1-1 Proposed Wah Wah Valley SEZ as Revised**

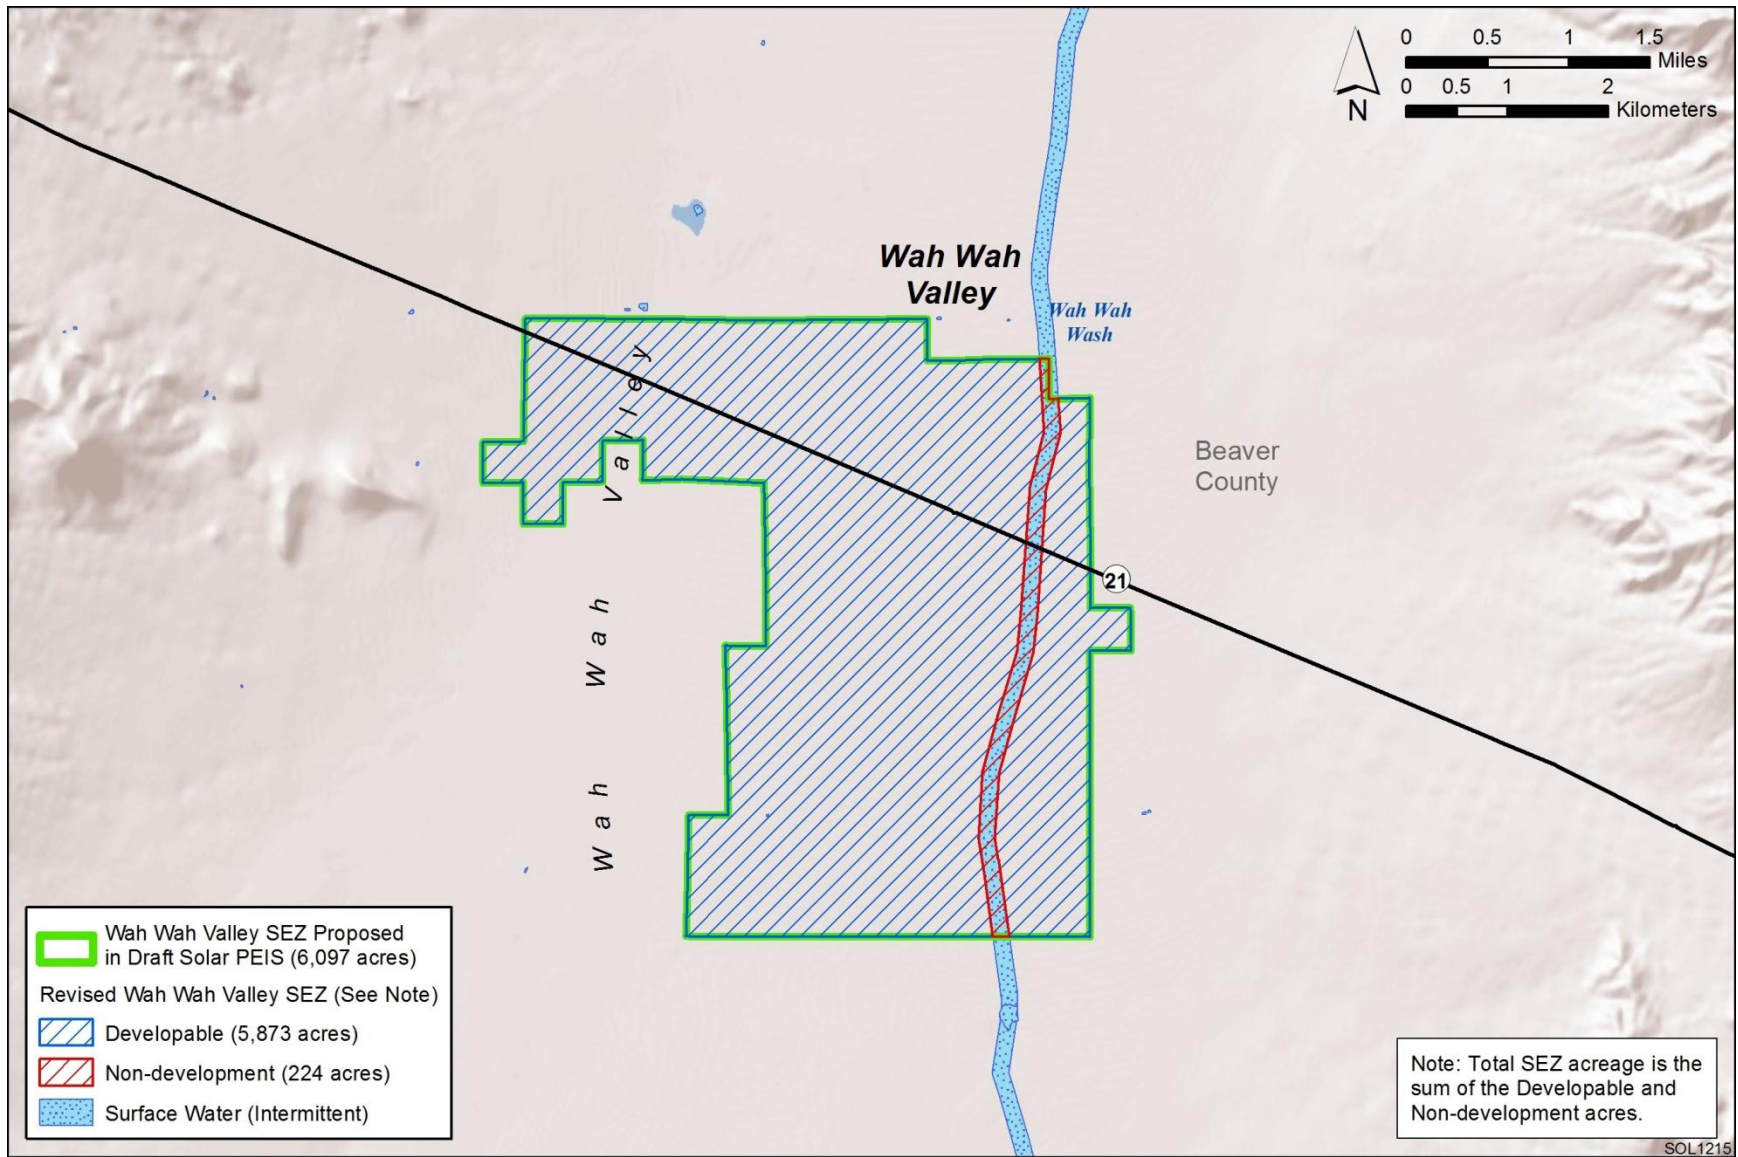

FIGURE 13.3.1.1-2 Developable and Non-development Areas for the Proposed Wah Wah Valley SEZ as Revised

1 **TABLE 13.3.1.2-1 Assumed Development Acreages, Solar MW Output, and Nearest Major**
 2 **Access Road and Transmission Line for the Proposed Wah Wah Valley SEZ as Revised**

Total Developable Acreage and Assumed Developed Acreage (80% of Total)	Assumed Maximum SEZ Output for Various Solar Technologies	Distance to Nearest State, U.S., or Interstate Highway	Distance and Capacity of Nearest Existing Transmission Line	Assumed Area of Road ROW	Distance to Nearest Designated Corridor ^f
5,873 acres ^a and 4,698 acres	522 MW ^b 940 MW ^c	State Route 21: adjacent	42 mi ^d and 130 kV	NA ^e	Adjacent

- a To convert acres to km², multiply by 0.004047.
- b Maximum power output if the SEZ were fully developed using power tower, dish engine, or PV technologies, assuming 9 acres/MW (0.04 km²/MW) of land required.
- c Maximum power output if the SEZ were fully developed using solar trough technologies, assuming 5 acres/MW (0.02 km²/MW) of land required.
- d To convert mi to km, multiply by 1.609.
- e NA = no access road construction is assumed necessary for Wah Wah Valley.
- f BLM-designated corridors are developed for federal land use planning purposes only and are not applicable to state-owned or privately owned land.

3
 4
 5 of new capacity. Therefore, at full build-out capacity, new transmission and possibly also
 6 upgrades of existing transmission lines would be required to bring electricity from the proposed
 7 Wah Wah Valley SEZ to load centers. An assessment of the most likely load center destinations
 8 for power generated at the Wah Wah Valley SEZ and a general assessment of the impacts of
 9 constructing and operating new transmission facilities to those load centers are provided in
 10 Section 13.3.23. In addition, the generic impacts of transmission and associated infrastructure
 11 construction and of line upgrades for various resources are discussed in Chapter 5 of this Final
 12 Solar PEIS. Project-specific analyses would also be required to identify the specific impacts of
 13 new transmission construction and line upgrades for any projects proposed within the SEZ.

14
 15 The transmission assessment for the Wah Wah Valley SEZ has been updated, and the
 16 hypothetical transmission corridor assessed in the Draft Solar PEIS is no longer applicable.
 17 For this Final Solar PEIS, the 1,273 acres (5.2 km²) of land disturbance for a hypothetical
 18 transmission corridor to the existing transmission line is no longer assumed (although the
 19 impacts of required new transmission overall are addressed in Section 13.3.23).

20
 21

1 The Wah Wah Valley SEZ partially overlaps a Section 368 federally designated energy
2 corridor that runs east–west through the SEZ along State Route 21.¹ For this impact assessment,
3 it is assumed that up to 80% of the proposed SEZ could be developed. This does not take into
4 account the potential limitations to solar development that may result from siting constraints
5 associated with the corridor. The development of solar facilities and the existing corridor will be
6 dealt with by the BLM on a case-by-case basis; see Section 13.3.2.2 on impacts on lands and realty
7 for further discussion.
8

9 For the proposed Wah Wah Valley SEZ, existing road access should be adequate to
10 support construction and operation of solar facilities, because State Route 21 runs from west to
11 east through the northern portion of the SEZ. Thus, no additional road construction outside of the
12 SEZ is assumed to be required to support solar development, as summarized in Table 13.3.1.2-1.
13

14 **13.3.1.3 Programmatic and SEZ-Specific Design Features**

15
16
17 The proposed programmatic design features for each resource area to be required under
18 the BLM Solar Energy Program are presented in Section A.2.2 of Appendix A of this Final Solar
19 PEIS. These programmatic design features are intended to avoid, reduce, and/or mitigate adverse
20 impacts of solar energy development, and will be required for development on all BLM-
21 administered lands, including SEZ and non-SEZ lands.
22

23 The discussions below addressing potential impacts of solar energy development on
24 specific resource areas (Sections 13.3.2 through 13.3.22) also provide an assessment of the
25 effectiveness of the programmatic design features in mitigating adverse impacts from solar
26 development within the SEZ. SEZ-specific design features to address impacts specific to the
27 proposed Wah Wah Valley SEZ may be required in addition to the programmatic design
28 features. The proposed SEZ-specific design features for the Wah Wah Valley SEZ have been
29 updated on the basis of revisions to the SEZ since the Draft Solar PEIS (such as boundary
30 changes and the identification of non-development areas) and on the basis of comments received
31 on the Draft and Supplement to the Draft Solar PEIS. All applicable SEZ-specific design features
32 identified to date (including those from the Draft Solar PEIS that are still applicable) are
33 presented in Sections 13.3.2 through 13.3.22.
34
35
36

¹ Section 368 of the Energy Policy Act of 2005 (P.L. 109-58) required federal agencies to engage in transmission corridor planning (see Section 1.6.2.1 of the Draft Solar PEIS). As a result of this mandate, the BLM, DOE, USFS, and DoD prepared a PEIS to evaluate the designation of energy corridors on federal lands in 11 western states, including the 6 states evaluated in this study (DOE and DOI 2008). The BLM and USFS issued RODs to amend their respective land use plans to designate numerous corridors, often referred to as Section 368 corridors.

1 **13.3.2 Lands and Realty**

2
3
4 **13.3.2.1 Affected Environment**

5
6 The boundaries of the Wah Wah Valley SEZ as proposed in the Draft Solar PEIS have
7 not changed. A total of 224 acres (0.91 km²) of Wah Wah Wash have been identified as
8 non-development areas. The northern boundary of the SEZ is immediately adjacent to a ranch
9 homeplace, ranch buildings, and a feedlot and the access road to the ranch is within the SEZ.
10 The remaining description of the area in the Draft Solar PEIS is still valid.
11

12
13 **13.3.2.2 Impacts**

14
15 Full development of the SEZ would disturb up to 5,873 acres (23.8 km²) and would
16 exclude many existing and potential uses of the public land. Because the area is rural and
17 undeveloped, utility-scale solar energy development would introduce a new and discordant land
18 use into the area. Solar development along the northern boundary of the SEZ would dramatically
19 conflict with development on the adjacent private land.
20

21 The proposed Wah Wah Valley SEZ partially overlaps a Section 368 federally designated
22 energy corridor. This existing corridor will be used primarily for the siting of transmission lines
23 and other infrastructure such as pipelines. The existing corridor will be the preferred location
24 for any transmission development that is required to support solar development and future
25 transmission grid improvements related to the build-out of the Wah Wah Valley SEZ. Any use
26 of the corridor lands within the Wah Wah Valley SEZ for solar energy facilities, such as solar
27 panels or heliostats, must be compatible with the future use of the existing corridor. The BLM
28 will assess solar projects in the vicinity of existing corridor on a case-by-case basis. The BLM
29 will review and approve individual project plans of development to ensure compatible
30 development that maintains the use of the corridor.
31

32
33 **13.3.2.3 SEZ-Specific Design Features and Design Feature Effectiveness**

34
35 Required programmatic design features that would reduce impacts on lands and realty
36 activities are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing
37 the programmatic design features will provide some mitigation for identified impacts but will not
38 mitigate all adverse impacts. For example, impacts related to the exclusion of many existing and
39 potential uses of the public land; the visual impact of an industrial-type solar facility within an
40 otherwise rural area; and induced land use changes, if any, on nearby or adjacent state and
41 private lands may not be fully mitigated.
42

43 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
44 comments received as applicable, the following SEZ-specific design feature for lands and realty
45 has been identified:
46

- 1 • Development may need to be restricted in the northern portion of the SEZ
2 near the ranch development on private land to provide a buffer between
3 private land developments and solar energy facility development.
4

5 The need for additional SEZ-specific design features will be identified through the
6 process of preparing parcels for competitive offer and subsequent project-specific analysis.
7
8

9 **13.3.3 Specially Designated Areas and Lands with Wilderness Characteristics**

10 11 12 **13.3.3.1 Affected Environment**

13
14 Two WSAs and two wilderness inventory units are within 25 mi (40 km) of the proposed
15 Wah Wah Valley SEZ. The description of the area in the Draft Solar PEIS remains valid.
16
17

18 **13.3.3.2 Impacts**

19
20 Solar energy development within the proposed SEZ is anticipated to have adverse
21 impacts on wilderness characteristics of the Wah Wah Mountains WSA and on the Central and
22 Northern Wah Wah Mountains wilderness inventory units. The analysis in the Draft Solar PEIS
23 remains valid.
24
25

26 **13.3.3.3 SEZ-Specific Design Features and Design Feature Effectiveness**

27
28 Required programmatic design features that would reduce impacts on specially
29 designated areas are described in Section A.2.2 of Appendix A of this Final Solar PEIS
30 (design features for both specially designated areas and visual resources would address impacts).
31 Implementing the programmatic design features may provide some mitigation for the identified
32 impacts, but the adverse impacts on wilderness characteristics in the WSAs and the two
33 wilderness inventory units would not be fully mitigated.
34

35 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
36 comments received as applicable, no SEZ-specific design features for specially designated areas
37 and lands with wilderness characteristics have been identified in this Final Solar PEIS. Some
38 SEZ-specific design features may be identified through the process of preparing parcels for
39 competitive offer and subsequent project-specific analysis.
40
41
42

1 **13.3.4 Rangeland Resources**

2
3
4 **13.3.4.1 Livestock Grazing**

5
6
7 ***13.3.4.1.1 Affected Environment***

8
9 One perennial grazing allotment overlies the proposed Wah Wah Valley SEZ. The
10 description of the area in the Draft Solar PEIS remains valid.
11

12
13 ***13.3.4.1.2 Impacts***

14
15 Less than 3% of the Wah Wah Lawson allotment would be directly affected by full
16 development of the SEZ, but the permittee has indicated that because of the location of the SEZ,
17 he will encounter difficulties with watering his livestock. Because of the size of the allotment, it
18 is possible that the potential loss of 221 AUMs within the SEZ could be replaced elsewhere in
19 the allotment, but it is not clear at the current level of analysis how issues associated with
20 livestock watering can be effectively addressed. Should the 221 AUMs be lost, there would be an
21 economic loss to the ranch operation. Should the livestock-watering issue not be solvable, an
22 additional loss of AUMs would likely occur. This will have to be addressed at the site-specific
23 level when a proposal for solar energy development is being considered.
24

25 Economic impacts of the loss of grazing capacity must be determined at the allotment-
26 specific level. For most public land grazing operations, any loss of grazing capacity is an
27 economic concern, but it is not possible to assess the extent of that specific impact at this
28 programmatic level. For that reason, only a general assessment is made based on the projected
29 loss of livestock AUMs; this assessment does not consider potential impacts on management
30 costs, on reducing the scale of an operation, or on the value of the ranch, including private land
31 values and other grazing associated assets.
32

33 The remaining discussion of impacts in the Draft Solar PEIS is still applicable.
34

35
36 ***13.3.4.1.3 SEZ-Specific Design Features and Design Feature Effectiveness***

37
38 Required programmatic design features that would reduce impacts on livestock grazing
39 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the
40 programmatic design features could provide adequate mitigation for identified impacts
41 associated with the livestock watering issues but will not mitigate for any loss of livestock
42 AUMs, or the loss of value in ranching operations including private land values.
43

44 No SEZ-specific design features to protect livestock grazing have been identified in this
45 Final Solar PEIS. Some SEZ-specific design features may be identified through the process of
46 preparing parcels for competitive offer and subsequent project-specific analysis.

1 **13.3.4.2 Wild Horses and Burros**

2
3
4 ***13.3.4.2.1 Affected Environment***

5
6 As presented in the Draft Solar PEIS, no wild horse or burro HMAs occur within the
7 proposed Wah Wah Valley SEZ or in close proximity to it.

8
9
10 ***13.3.4.2.2 Impacts***

11
12 As presented in the Draft Solar PEIS, solar energy development within the proposed
13 Wah Wah Valley SEZ would not affect wild horses and burros.

14
15
16 ***13.3.4.2.3 SEZ-Specific Design Features and Design Feature Effectiveness***

17
18 Because solar energy development within the proposed Wah Wah Valley SEZ would not
19 affect wild horses and burros, no SEZ-specific design features to address wild horses and burros
20 have been identified in this Final Solar PEIS.

21
22
23 **13.3.5 Recreation**

24
25
26 **13.3.5.1 Affected Environment**

27
28 The proposed Wah Wah Valley SEZ offers little potential for extensive significant
29 recreational use, although it is likely that local residents use it for general recreational purposes.
30 The description in the Draft Solar PEIS remains valid.

31
32
33 **13.3.5.2 Impacts**

34
35 Recreational users would be excluded from any portions of the SEZ developed for solar
36 energy production, but recreational impacts are anticipated to be low.

37
38 In addition, lands that are outside of the proposed SEZ may be acquired or managed for
39 mitigation of impacts on other resources (e.g., sensitive species). Managing these lands for
40 mitigation could further exclude or restrict recreational use, potentially leading to additional
41 losses in recreational opportunities in the region. The impact of acquisition and management of
42 mitigation lands would be considered as a part of the environmental analysis of specific solar
43 energy projects.

44
45 The remaining discussion of impacts on recreation in the Draft Solar PEIS remains valid.

1 **13.3.5.3 SEZ-Specific Design Features and Design Feature Effectiveness**
2

3 Required programmatic design features that would reduce impacts on recreational
4 resources are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing
5 the programmatic design features will provide some mitigation for identified impacts with the
6 exception of the exclusion of recreational users from developed portions of the SEZ.
7

8 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration
9 of comments received as applicable, no SEZ-specific design features to protect recreational
10 resources have been identified in this Final Solar PEIS. Some SEZ-specific design features
11 may ultimately be identified through the process of preparing parcels for competitive offer and
12 subsequent project-specific analysis.
13

14
15 **13.3.6 Military and Civilian Aviation**
16

17
18 **13.3.6.1 Affected Environment**
19

20 There are no identified military or civilian aviation uses in near proximity to the proposed
21 Wah Wah Valley SEZ.
22

23
24 **13.3.6.2 Impacts**
25

26 The southeastern boundary of the Utah Test and Training Range is about 5 mi (8 km)
27 northwest of the SEZ. There are no identified impacts on military or civilian aviation facilities
28 associated with the proposed Wah Wah Valley SEZ.
29

30
31 **13.3.6.3 SEZ-Specific Design Features and Design Feature Effectiveness**
32

33 Required programmatic design features that would reduce impacts on military and
34 civilian aviation are described in Section A.2.2 of Appendix A of this Final Solar PEIS. The
35 programmatic design features require early coordination with the DoD to identify and avoid,
36 minimize, and/or mitigate, if possible, any potential impacts on the use of military airspace.
37 Implementing programmatic design features will reduce the potential for impacts on military
38 and civilian aviation.
39

40 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration
41 of comments received as applicable, no SEZ-specific design features for military or civilian
42 aviation have been identified in this Final Solar PEIS. Some SEZ-specific design features may
43 be identified through the process of preparing parcels for competitive offer and subsequent
44 project-specific analysis.
45
46

1 **13.3.7 Geologic Setting and Soil Resources**

2
3
4 **13.3.7.1 Affected Environment**

5
6
7 **13.3.7.1.1 Geologic Setting**

8
9 Data provided in the Draft Solar PEIS remain valid. The boundaries of the proposed
10 Wah Wah Valley SEZ remain the same, but 224 acres (0.91 km²) of the Wah Wah Wash have
11 been identified as non-development areas.

12
13
14 **13.3.7.1.2 Soil Resources**

15
16 Data provided in the Draft Solar PEIS remain valid, with the following update:

- 17
18 • Table 13.3.7.1-1 provides revised areas for soil map units taking into account
19 the non-development area within the Wah Wah Valley SEZ as revised.

20
21
22 **13.3.7.2 Impacts**

23
24 Impacts on soil resources would occur mainly as a result of ground-disturbing activities
25 (e.g., grading, excavating, and drilling), especially during the construction phase of a solar
26 project. Because the developable area of the SEZ has changed by less than 4%, the assessment of
27 impacts provided in the Draft Solar PEIS remains valid, with the following updates:

- 28
29 • Impacts related to wind erodibility are somewhat reduced, because the
30 identification of non-development areas eliminates 205 acres (0.82 km²) of
31 moderately erodible soils from development (riverwash soils are not rated for
32 wind erodibility).
- 33
34 • Impacts related to water erodibility are somewhat reduced, because the
35 identification of non-development areas eliminates 61 acres (0.25 km²) of
36 moderately erodible soils from development (riverwash soils are not rated for
37 water erosion potential).

38
39
40 **13.3.7.3 SEZ-Specific Design Features and Design Feature Effectiveness**

41
42 Required programmatic design features that would reduce impacts on soils are described
43 in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the programmatic design
44 features will reduce the potential for soil impacts during all project phases.

1 **TABLE 13.3.7.1-1 Summary of Soil Map Units within the Proposed Wah Wah Valley SEZ as Revised**

Map Unit Symbol ^a	Map Unit Name	Erosion Potential		Description	Area in Acres ^d (Percentage of SEZ)
		Water ^b	Wind ^c		
182	Siltcliffe silty clay loam (0 to 3% slopes)	Moderate	Moderate (WEG 6) ^e	Nearly level soils on alluvial flats. Parent material consists of alluvium from igneous and sedimentary rocks. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is moderate. Partially hydric. Severe rutting hazard. Used for livestock grazing and wildlife habitat.	3,363 (55.2) ^f
183	Siltcliffe–Hiko Springs–Dera complex (0 to 3% slopes)	Slight	Moderate (WEG 3)	Nearly level soils (very fine sandy loams) on alluvial flats. Parent material consists of alluvium from igneous and sedimentary rocks. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is moderate. Moderate rutting hazard. Used for rangeland and wildlife habitat.	1,386 (22.7) ^g
180	Siltcliffe–Thermosprings complex (0 to 2% slopes)	Slight	Moderate (WEG 3)	Nearly level soils (sandy loams) on alluvial flats. Parent material consists of alluvium from igneous and sedimentary rocks. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is moderate. Partially hydric. Moderate rutting hazard. Used for rangeland and wildlife habitat.	442 (7.3) ^h
176	Dera–Lynndyl complex (0 to 3% slopes)	Slight	Moderate (WEG 4)	Nearly level soils (sandy clay loams) on alluvial fan skirts. Parent material consists of eolian material, alluvium, and colluvium from igneous and sedimentary rocks and lacustrine deposits. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is low. Moderate rutting hazard. Used for rangeland and wildlife habitat.	363 (6.0)
177	Dera sandy clay loam (0 to 5% slopes)	Slight	Moderate (WEG 4)	Nearly level soils on alluvial fan skirts and relict longshore bars. Parent material consists of alluvium from igneous and sedimentary rocks. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is low. Moderate rutting hazard. Used for rangeland and wildlife habitat.	260 (4.3)

TABLE 13.3.7.1-1 (Cont.)

Map Unit Symbol ^a	Map Unit Name	Erosion Potential		Description	Area in Acres ^d (Percentage of SEZ)
		Water ^b	Wind ^c		
181	Siltcliffe sandy clay loam (0 to 2% slopes)	Slight	Moderate (WEG 4)	Nearly level soils on alluvial flats. Parent material consists of alluvium from igneous and sedimentary rocks and lacustrine deposits. Soils are very deep and well drained, with moderate surface-runoff potential and high permeability. Available water capacity is high. Severe rutting hazard. Used for rangeland and wildlife habitat.	143 (2.3)
175	Hiko Peak, dry-Lynndyl association	Slight	Moderate (WEG 5)	Nearly level soils (cobbly sandy loams) on alluvial fan skirts and relict longshore bars. Parent material consists of alluvium from igneous and sedimentary rocks. Soils are very deep and well drained, with low surface-runoff potential (high infiltration rate) and high permeability. Available water capacity is low. Moderate rutting potential. Used for rangeland and wildlife habitat.	111 (1.8)
135	Riverwash (4 to 15% slopes)	Not rated	Not rated	Riverwash soils within streams and channels; occasional flooding. All hydric. Rutting hazard not rated.	29 (<1.0) ⁱ

^a Map unit symbols are shown in Figure 13.3.7.1-5 of the Draft Solar PEIS.

^b Water erosion potential rates the hazard of soil loss from off-road and off-trail areas after disturbance activities that expose the soil surface. The ratings are based on slope and soil erosion factor K (whole soil; does not account for the presence of rock fragments) and represent soil loss caused by sheet or rill erosion where 50 to 75% of the surface has been exposed by ground disturbance. A rating of “slight” indicates that erosion is unlikely under ordinary climatic conditions. A rating of “severe” indicates that erosion is expected; loss of soil productivity and damage are likely and erosion control measures may be costly or impractical. A rating of “moderate” indicates that erosion could be expected under ordinary climatic conditions.

^c Wind erosion potential here is based on the wind erodibility group (WEG) designation: groups 1 and 2, high; groups 3 through 6, moderate; and groups 7 and 8 low (see footnote d for further explanation).

^d To convert acres to km², multiply by 0.004047.

Footnotes continued on next page.

TABLE 13.3.7.1-1 (Cont.)

-
- ^e WEGs are based on soil texture, content of organic matter, effervescence of carbonates, content of rock fragments, and mineralogy, and also take into account soil moisture, surface cover, soil surface roughness, wind velocity and direction, and the length of unsheltered distance (USDA 2004). Groups range in value from 1 (most susceptible to wind erosion) to 8 (least susceptible to wind erosion). The NRCS provides a wind erodibility index, expressed as an erosion rate in tons per acre per year, for each of the wind erodibility groups: WEG 1, 220 tons (200 metric tons) per acre (4,000 m²) per year (average); WEG 2, 134 tons (122 metric tons) per acre (4,000 m²) per year; WEGs 3 and 4 (and 4L), 86 tons (78 metric tons) per acre (4,000 m²) per year; WEG 5, 56 tons (51 metric tons) per acre (4,000 m²) per year; WEG 6, 48 tons (44 metric tons) per acre (4,000 m²) per year; WEG 7, 38 tons (34 metric tons) per acre (4,000 m²) per year; and WEG 8, 0 tons (0 metric tons) per acre (4,000 m²) per year.
- ^f A total of 61 acres (0.25 km²) within the Siltcliffe silty clay loam in the northern portion of the SEZ is currently categorized as a non-development area.
- ^g A total of 123 acres (0.50 km²) within Siltcliffe–Hiko Springs–Dera complex is currently categorized as a non-development area.
- ^h A total of 21 acres (0.085 km²) within the Siltcliffe–Thermosprings complex is currently categorized as a non-development area.
- ⁱ A total of 19 acres (0.077 km²) of riverwash in the southern portion of the SEZ is currently categorized as a non-development area.

Source: NRCS (2010).

1 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
2 comments received as applicable, no SEZ-specific design features for soil resources were
3 identified. Some SEZ-specific design features may be identified through the process of preparing
4 parcels for competitive offer and subsequent project-specific analysis.
5
6

7 **13.3.8 Minerals (Fluids, Solids, and Geothermal Resources)**

8

9 A mineral potential assessment for the proposed Wah Wah Valley SEZ has been prepared
10 and reviewed by BLM mineral specialists knowledgeable about the region where the SEZ is
11 located (BLM 2012a). The BLM is proposing to withdraw the SEZ from settlement, sale,
12 location, or entry under the general land laws, including the mining laws, for a period of 20 years
13 (see Section 2.2.2.2.4 of the Final Solar PEIS). The potential impacts of this withdrawal are
14 discussed in Section 13.3.24.
15
16

17 **13.3.8.1 Affected Environment**

18

19 No known locatable minerals are present within the proposed Wah Wah Valley SEZ, and
20 there are no oil and gas leases in the SEZ. There were geothermal leases located southeast of the
21 SEZ, but those are now closed. No geothermal development has occurred within or near the SEZ.
22 The description in the Draft Solar PEIS remains valid.
23
24

25 **13.3.8.2 Impacts**

26

27 No impacts on mineral resources were identified in the Draft Solar PEIS. The analysis in
28 the Draft Solar PEIS remains valid.
29
30

31 **13.3.8.3 SEZ-Specific Design Features and Design Feature Effectiveness**

32

33 Required programmatic design features that would reduce impacts on mineral resources
34 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the
35 programmatic design features will provide adequate protection of mineral resources.
36

37 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration
38 of comments received as applicable, no SEZ-specific design features for minerals have been
39 identified in this Final Solar PEIS. Some SEZ-specific design features may be identified through
40 the process of preparing parcels for competitive offer and subsequent project-specific analysis.
41
42
43

1 **13.3.9 Water Resources**

2
3
4 **13.3.9.1 Affected Environment**

5
6 The description of the affected environment given in the Draft Solar PEIS relevant to
7 water resources at the proposed Wah Wah Valley SEZ remains valid and is summarized in the
8 following paragraphs.
9

10 The Wah Wah Valley SEZ is located within the Escalante Desert–Sevier Lake subregion
11 of the Great Basin hydrologic region. The SEZ is located in the Wah Wah Valley, which is a
12 closed basin, with the Wah Wah Mountains to the west, San Francisco Mountain to the east, low-
13 lying hills to the south, and a drainage divide to the north. Average precipitation is estimated to
14 be 7 in./yr (18 cm/yr), with snowfalls of 5 in./yr (13 cm/yr), and the average pan evaporation rate
15 is estimated to be 71 in./yr (180 cm/yr). There are no perennial surface water features within the
16 Wah Wah Valley, but the Wah Wah Wash runs northward through the SEZ. The area around the
17 Wah Wah Wash has been identified as non-development lands totaling 224 acres (0.91 km²).
18 The area has not been examined for flood risk, but any flooding would be limited to local
19 ponding and erosion. No wetlands have been identified in or around the SEZ.
20

21 Groundwater in the Wah Wah Valley is found in basin-fill deposits and in underlying
22 regional carbonate-rock aquifers. The basin-fill aquifer is on the order of 1,000 to 4,000 ft
23 (305 to 1,219 m) in thickness and is composed of intermixed particles ranging from clays to
24 boulders. The carbonate-rock aquifer under the Wah Wah Valley is highly fractured and
25 connected to the Fish Springs Flow System, which includes Pine Valley, Snake Valley, Tule
26 Valley, and Fish Springs Flat, all located to the north and west of Wah Wah Valley in Nevada.
27 Wah Wah Spring is a series of springs located 2 mi (3.2 km) west of the SEZ and is a local
28 discharge point of the carbonate rock aquifer. Recent studies estimate the discharge of Wah Wah
29 Spring to be 1,530 ac-ft/yr (1.9 million m³/yr). Groundwater recharge is estimated to be
30 10,000 ac-ft/yr (12.3 million m³/yr) and is primarily supplied by groundwater discharge from
31 adjacent basins and mountain front recharge in the Wah Wah Valley. Groundwater typically
32 flows northward along the axis of the valley in the basin-fill aquifer, while groundwater flows
33 toward Fish Springs Flat in the regional carbonate-rock aquifer. A monitoring well around the
34 SEZ indicates a depth to groundwater of 660 ft (201 m). The water quality of the groundwater
35 is considered hard, with a majority of water samples having total dissolved solids (TDS)
36 concentrations above the secondary MCL; a small number of samples had sulfate concentrations
37 greater than the secondary MCL.
38

39 In Utah, water resources are considered public, and water rights are allocated by the
40 UDWR. The Wah Wah Valley is under the jurisdiction of the southwestern region office of the
41 UDWR and is located in Policy Area 69 (Wah Wah Valley and Sevier Lake). Two pending
42 groundwater applications have the potential to withdraw substantial groundwater quantities. The
43 limited information on groundwater resources in Wah Wah Valley, in addition to information
44 regarding the connectivity of the basin-fill aquifer to the regional carbonate aquifer, has
45 prompted the U.S. Department of the Interior to initiate a groundwater investigation to assess
46 potential impacts on groundwater resources in this region. Preliminary groundwater modeling

1 results consider five projected groundwater pumping scenarios, all of which include the proposed
 2 applications in the Wah Wah Valley, and suggest that several hundred feet of drawdown could
 3 occur in the vicinity of the Wah Wah Valley (Durbin and Loy 2010).
 4

5 In addition to the water resources information provided in the Draft Solar PEIS, this
 6 section provides a planning-level inventory of available climate, surface water, and groundwater
 7 monitoring stations within the immediate vicinity of the Wah Wah Valley SEZ and the
 8 surrounding basin. Additional data regarding climate, surface water, and groundwater conditions
 9 are presented in Tables 13.3.9.1-1 through 13.3.9.1-7 and in Figures 13.3.9.1-1 and 13.3.9.1-2.
 10 Fieldwork and hydrologic analyses needed to determine 100-year floodplains and jurisdictional
 11 water bodies would need to be coordinated with appropriate federal, state, and local agencies.
 12 Areas within the Wah Wah Valley SEZ that are found to be within a 100-year floodplain will be
 13 identified as non-development areas. Any water features within the Wah Wah Valley SEZ
 14 determined to be jurisdictional will be subject to the permitting process described in the CWA.
 15

17 13.3.9.2 Impacts

19 13.3.9.2.1 Land Disturbance Impacts on Water Resources

21 The discussion of land disturbance effects on water resources in the Draft Solar PEIS
 22 remains valid. As stated in the Draft Solar PEIS, land disturbance activities could potentially
 23 affect drainage patterns, along with groundwater recharge and discharge processes. In particular,
 24 land disturbance impacts in the vicinity of the Wah Wah Valley SEZ could result in increased
 25 erosion and sedimentation along the Wah Wah Wash. The identification of Wah Wah Wash and
 26 portions of its riparian regions as non-development areas reduces the potential for adverse
 27 impacts associated with land disturbance activities.

Land clearing, land leveling, and vegetation removal during the development of the SEZ have the potential to disrupt intermittent/ephemeral stream channels. Several programmatic design features described in Section A.2.2 of Appendix A of this Final PEIS would avoid, minimize, and/or mitigate programmatic impacts associated with the disruption of intermittent/ephemeral water features. Additional analyses of intermittent/ephemeral streams are presented in this update, including an evaluation of functional aspects of stream channels with respect to groundwater recharge, flood conveyance, sediment transport, geomorphology, and ecological habitats. Only a summary of the results from these surface water analyses is presented in this section; more information on methods and results is presented in Appendix O.

The study region considered for the intermittent/ephemeral stream evaluation relevant to the Wah Wah Valley SEZ is a subset of the Sevier Lake watershed (HUC8), for which information regarding stream channels is presented in Tables 13.3.9.1-3 and 13.3.9.1-4 in this Final Solar PEIS. The evaluation categorized flow lines from the National Hydrography Dataset (USGS 2012a) as having low, moderate, and high sensitivity to land disturbance. Within the study area, 30% of the intermittent/ephemeral stream channels had low sensitivity, 55% had moderate sensitivity, and 15% had high sensitivity to land disturbance (Figure 13.3.9.2-1). Within the Wah Wah Valley SEZ, the majority of intermittent/ephemeral stream channels were low sensitivity reaches, one channel in the western portion of the SEZ had moderate sensitivity, and the majority of the high sensitivity reaches were just to the west of the SEZ found in channels draining the Wah Wah Mountains (Figure 13.3.9.2-1). Any alterations to intermittent/ephemeral stream channels in the SEZ would be subject to review by the Utah DWR’s Stream Alteration Program, which considers natural streams features that receive enough water for sustaining ecosystems that can be observed primarily by vegetation patterns (Utah DWR 2004).

13.3.9.2.2 Water Use Requirements for Solar Energy Technologies

The water use requirements for full build-out scenarios of the Wah Wah Valley SEZ have not changed from the values presented in the Draft Solar PEIS (see Tables 13.3.9.2-1 and 13.3.9.2-2 in the Draft Solar PEIS). This section presents additional analyses of groundwater, which includes a basin-scale water budget and a simplified, one-dimensional groundwater model to assess groundwater drawdown for various development scenarios. Only a summary of the results from these groundwater analyses is presented in this section; more information on methods and results is presented in Appendix O.

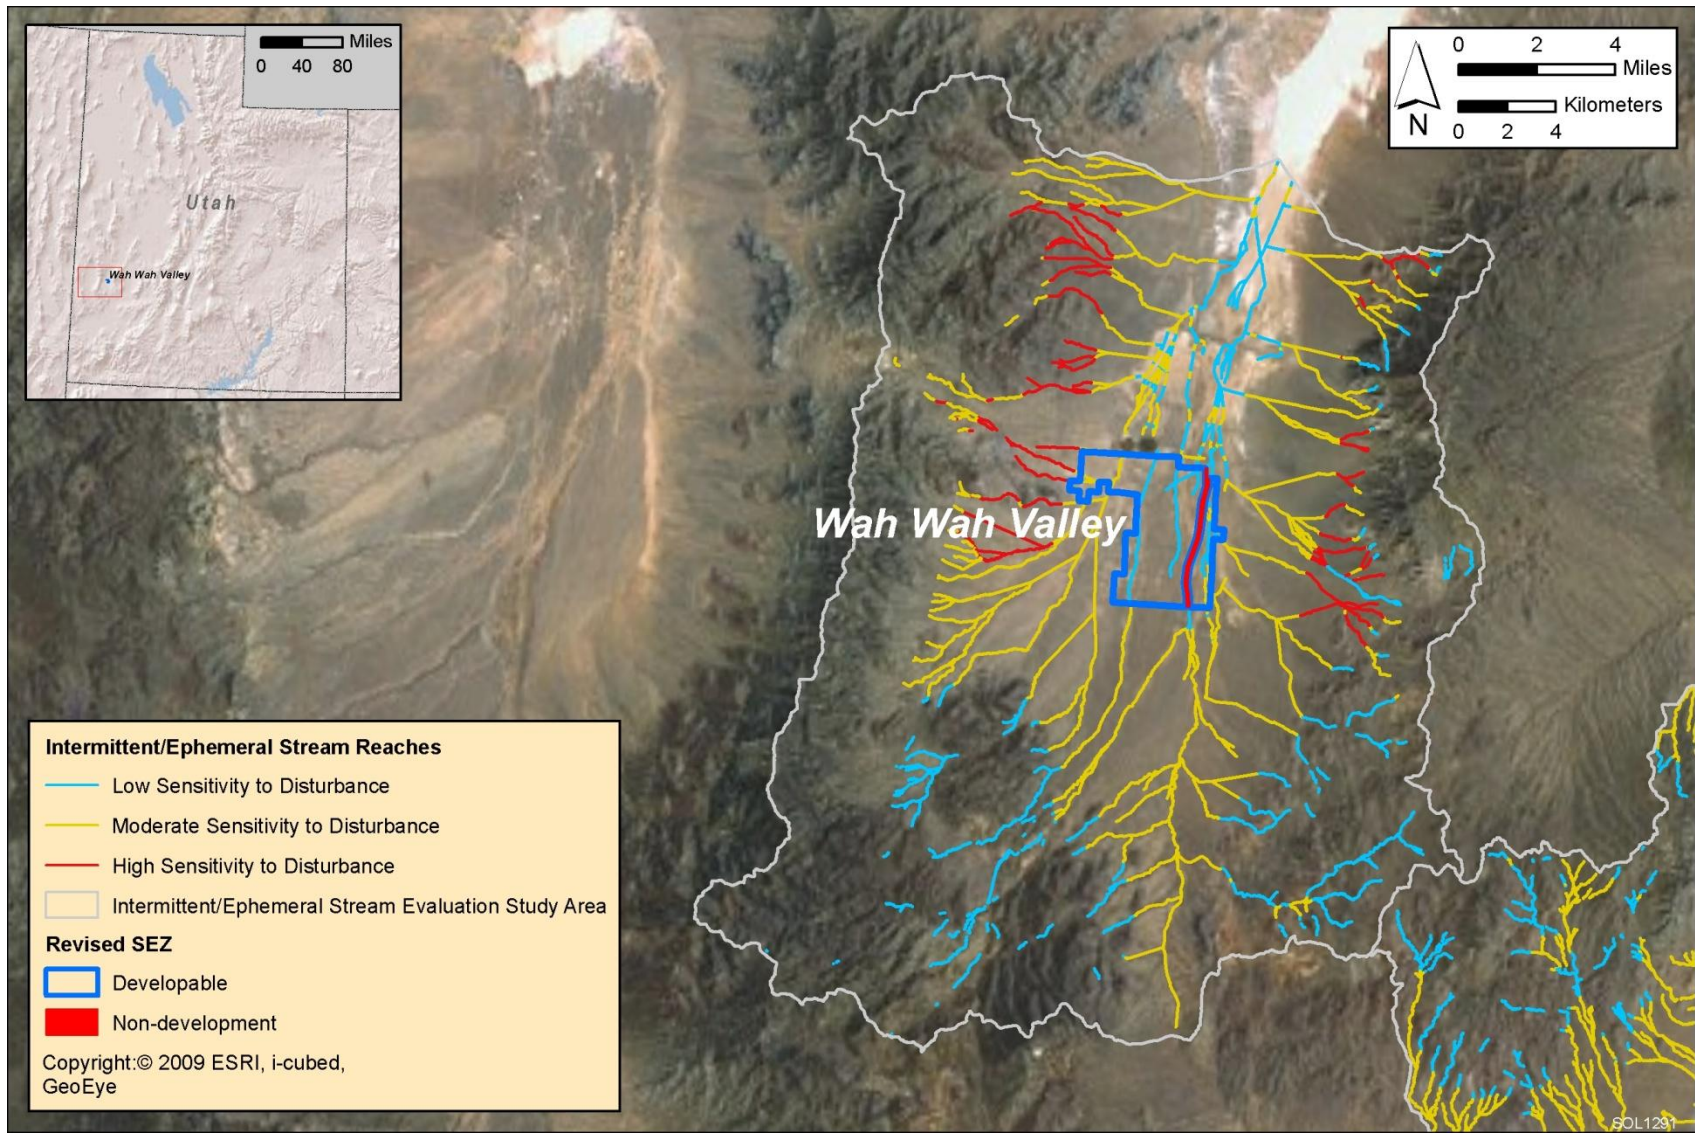

FIGURE 13.3.9.2-1 Intermittent/Ephemeral Stream Channel Sensitivity to Surface Disturbances in the Vicinity of the Proposed Wah Wah Valley SEZ as Revised

1 A basin-scale groundwater budget was assembled using available data on groundwater
2 inputs, outputs, and storage (Table 13.3.9.2-1) in order to compare with water use estimates
3 related to solar energy development. The estimated total water use requirements during the peak
4 construction year are as high as 1,261 ac-ft/yr (1.6 million m³/yr), which represents 23% of the
5 annual recharge from precipitation for the basin. Given the short duration of construction
6 activities, the water use estimate for construction is not a primary concern to water resources
7 in the basin. The long duration of groundwater pumping during operations (20 years) poses a
8 greater threat to groundwater resources. This analysis considered low, medium, and high
9 groundwater pumping scenarios that represent full build-out of the SEZ assuming PV, dry-
10 cooled parabolic trough, and wet-cooled parabolic trough, respectively (a 30% operational time
11 was considered for all the solar facility types on the basis of operations estimates for proposed
12 utility-scale solar energy facilities). The low, medium, and high pumping scenarios result in
13 groundwater withdrawals that range from 28 to 4,892 ac-ft/yr (34,500 to 6 million m³/yr), or a
14 total of 560 to 97,840 ac-ft (690,700 to 121 million m³) over the 20-year analysis period. From
15 a groundwater budgeting perspective, the high pumping scenario would represent 90% of the
16 recharge by precipitation and 22% of the total groundwater inputs to the basin. The groundwater
17 withdrawals associated with the low and medium pumping scenarios represent 1% and 13%,
18 respectively, of the amount of recharge by precipitation to the basin. The low and medium
19 pumping scenario groundwater withdrawal rates are more in the realm of suitable recharge-based
20 sustainable yield estimates, although sustainable yield estimates based solely on recharge are
21 typically not recommended (Zhou 2009).

22
23 Groundwater budgeting allows quantification of complex groundwater processes at the
24 basin scale, but it ignores the temporal and spatial components of how groundwater withdrawals
25 affect groundwater surface elevations, groundwater flow rates, and connectivity to surface water
26 features such as streams, wetlands, playas, and riparian vegetation. A one-dimensional
27 groundwater modeling analysis was performed to present a simplified depiction of the spatial
28 and temporal effects of groundwater withdrawals by examining groundwater drawdown in a
29 radial direction around the center of the SEZ for the low, medium, and high pumping scenarios.
30 The specifics of the groundwater modeling analysis are presented in Appendix O; however, the
31 aquifer parameters used for the one-dimensional groundwater model (Table 13.3.9.2-2) represent
32 available literature data, and the model aggregates these value ranges into a simplistic
33 representation of the aquifer.

34
35 Currently, depth to groundwater in the basin-fill aquifer is on the order of 600 ft (183 m)
36 in the vicinity of the SEZ. The connectivity between the basin-fill and the regional-scale
37 carbonate rock aquifer, which lies underneath the basin and outcrops along the Wah Wah
38 Mountains as the source water for the Wah Wah Springs area, is not fully realized. Modeling
39 results suggest that groundwater withdrawals for solar energy development would result in
40 groundwater drawdown in the vicinity of the SEZ (approximately a 2-mi [3.2-km] radius)
41 ranging up to 100 ft (30 m) for the high pumping scenario, 15 ft (5 m) for the medium pumping
42 scenario, and less than 1 ft (0.3 m) for the low pumping scenario (Figure 13.3.9.2-2). The
43 modeled groundwater drawdown is primarily limited to a 3-mi (5-km) radius of the SEZ for all
44 pumping scenarios; however, the Wah Wah Springs discharge area is located 2 mi (3.2 km) to
45 the west of the SEZ, and groundwater drawdown could affect this spring discharge area.

6
7 ***13.3.9.2.3 Off-Site Impacts: Roads and Transmission Lines***

8
9 As stated in the Draft Solar PEIS, impacts associated with the construction of roads
10 and transmission lines primarily deal with water use demands for construction, water quality
11 concerns relating to potential chemical spills, and land disturbance effects on the natural
12 hydrology. Water needed for transmission line construction activities (e.g., for soil compaction,
13 dust suppression, and potable supply for workers) could be trucked to the construction area from
14 an off-site source. If this occurred, water use impacts at the SEZ would be negligible. The Draft
15 Solar PEIS assessment of impacts on water resources from road and transmission line
16 construction remains valid.

17
18
19 ***13.3.9.2.4 Summary of Impacts on Water Resources***

20
21 The additional information and analyses of water resources presented in this update
22 agree with the information provided in the Draft Solar PEIS, which indicate that the Wah Wah
23 Valley SEZ is located in high-elevation desert valley with intermittent/ephemeral surface water
24 features, and groundwater is contained in a basin-fill aquifer overlaying a regional-scale
25 carbonate rock aquifer system. The depth to groundwater, more than 600 ft (183 m), suggests
26 limited groundwater availability in the basin, but the potential for connectivity with the regional-
27 scale carbonate rock aquifer system has generated two pending water right applications with a
28 combined groundwater withdrawal rate of more than 15,000 ac-ft/yr (18.5 million m³/yr).
29 Information regarding these pending water right applications is described in Section 13.3.9.1.3
30 of the Draft Solar PEIS, and these applications are currently under review by the Utah DWR.
31

1 Disturbances to intermittent/ephemeral streams within the Wah Wah Valley SEZ could
2 potentially affect natural drainage patterns along Wah Wah Wash, causing an increase in
3 sedimentation and erosion of this incised channel. Channel reaches that drain the Wah Wah
4 Mountains and just along the western edge of the SEZ have a high sensitivity to land disturbance
5 and could disrupt groundwater recharge processes. While several design features described in
6 Appendix A of this Final Solar PEIS attempt to protect and mitigate impacts on intermittent/
7 ephemeral streams, additional protection is provided by the Utah DWR's Stream Allocation
8 permitting program.
9

10 The analysis of water use requirements in comparison to the basin-scale groundwater
11 budget and groundwater modeling analyses suggest that the low and medium pumping scenarios
12 are preferred. The high pumping scenario has groundwater withdrawal rates that match
13 precipitation recharge to the basin and can potentially cause groundwater drawdown in the
14 vicinity of the Wah Wah Springs discharge area, which is connected to the regional-scale
15 carbonate rock aquifer. The availability of groundwater in the Wah Wah Valley will largely
16 depend on the outcome of the two large water right applications that are currently being
17 reviewed by the Utah DWR.
18

19 Predicting impacts associated with groundwater withdrawals in desert regions is often
20 difficult, given the heterogeneity of aquifer characteristics, the long time period between the
21 onset of pumping and its effects, and limited data. One of the primary mitigation measures to
22 protect water resources is the implementation of long-term monitoring and adaptive management
23 (see Section A.2.4 of Appendix A). For groundwater, this requires the combination of
24 monitoring and modeling to fully identify the temporal and spatial extent of potential impacts.
25 The groundwater modeling framework developed by Durbin and Loy (2010) for the regional-
26 scale carbonate rock aquifer in this region should be used as a basis to evaluate project-specific
27 development plans, along with supporting long-term monitoring and adaptive management plans
28 for the Wah Wah Valley SEZ.
29
30

31 **13.3.9.3 SEZ-Specific Design Features and Design Feature Effectiveness** 32

33 Required programmatic design features that would reduce impacts on surface water
34 and groundwater are described in Section A.2.2 of Appendix A of this Final Solar PEIS.
35 Implementing the programmatic design features will provide some protection of and reduce
36 impacts on water resources.
37

38 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
39 comments received as applicable, the following SEZ-specific design features for water resources
40 have been identified:
41

- 42 • Groundwater analyses suggest that full build-out of wet-cooled technologies is
43 not feasible; for mixed-technology development scenarios, any proposed wet-
44 cooled projects should utilize water conservation practices.
45

- 1 • During site characterization, coordination and permitting with Utah DWR
2 regarding Utah’s Stream Alteration Program would be required for any
3 proposed alterations to surface water features.
4

5 The need for additional SEZ-specific design features will be identified through the
6 process of preparing parcels for competitive offer and subsequent project-specific analysis.
7

8 9 **13.3.10 Vegetation**

10 11 12 **13.3.10.1 Affected Environment**

13
14 In the Supplement to the Draft Solar PEIS, 224 acres (0.91 km²) of the Wah Wah Wash
15 was identified as a non-development area in the Wah Wah Valley SEZ.
16

17 As presented in the Draft Solar PEIS, 8 cover types were identified within the area of the
18 proposed Wah Wah Valley SEZ, while 29 cover types were identified within the area of indirect
19 effects, including the assumed transmission line corridor and within 5 mi (8 km) of the SEZ
20 boundary. For this updated assessment, a specifically located hypothetical transmission line is no
21 longer being assumed (see Section 13.3.23 for an updated transmission assessment for this SEZ).
22 Sensitive habitats on the SEZ include ephemeral dry wash and playa habitats. Figure 13.3.10.1-1
23 shows the cover types within the affected area of the Wah Wah Valley SEZ as revised.
24

25 26 **13.3.10.2 Impacts**

27
28 As presented in the Draft Solar PEIS, the construction of solar energy facilities within
29 the proposed Wah Wah Valley SEZ would result in direct impacts on plant communities
30 because of the removal of vegetation within the facility footprint during land-clearing and land-
31 grading operations. Approximately 80% of the SEZ would be expected to be cleared with full
32 development of the SEZ. With consideration of the newly identified non-development area,
33 approximately 4,698 acres (19.01 km²) would be cleared.
34

35 Overall impact magnitude categories were based on professional judgment and include
36 (1) *small*: a relatively small proportion ($\leq 1\%$) of the cover type within the SEZ region would be
37 lost; (2) *moderate*: an intermediate proportion (> 1 but $\leq 10\%$) of a cover type would be lost; and
38 (3) *large*: $> 10\%$ of a cover type would be lost.
39

40 41 ***13.3.10.2.1 Impacts on Native Species***

42
43 The analysis presented in the Draft Solar PEIS for the original Wah Wah Valley SEZ
44 developable area indicated that development would result in a small impact on all land cover
45 types occurring within the SEZ (Table 13.3.10.1-1 in the Draft Solar PEIS). Development within
46 the revised Wah Wah Valley SEZ could still directly affect all the cover types evaluated in the

FIGURE 13.3.10.1-1 Land Cover Types within the Proposed Wah Wah Valley SEZ as Revised

1 Draft Solar PEIS; the reduction in the developable area would result in reduced impact levels on
2 most land cover types in the affected area, but the impact magnitudes would remain unchanged
3 compared to original estimates in the Draft Solar PEIS.
4

5 Because Wah Wah Wash has been identified as a non-development area, direct impacts
6 on the wash would not occur, although indirect impacts could still occur. Because a specific
7 transmission line route is no longer assumed, direct impacts on habitats that occur within the
8 previously identified transmission corridor also would not occur. As a result, direct impacts on
9 19 cover types that were present only within the transmission corridor, would not occur.
10 However, direct and indirect impacts on plant communities associated with playa habitats,
11 greasewood flats, or other intermittently flooded areas, or dry washes, within or near the SEZ, as
12 described in the Draft Solar PEIS, could still occur. Indirect impacts from groundwater use on
13 plant communities in the region that depend on groundwater, such as riparian communities
14 associated with springs, could also occur.
15
16

17 ***13.3.10.2 Impacts from Noxious Weeds and Invasive Plant Species*** 18

19 As presented in the Draft Solar PEIS, land disturbance from project activities and indirect
20 effects of construction and operation within the Wah Wah Valley SEZ could potentially result in
21 the establishment or expansion of noxious weeds and invasive species populations, potentially
22 including those species listed in Section 13.3.10.1 in the Draft Solar PEIS. Such impacts as
23 reduced restoration success and possible widespread habitat degradation could still occur;
24 however, a small reduction in the potential for such impacts would result from the reduced
25 developable area of the SEZ.
26
27

28 **13.3.10.3 SEZ-Specific Design Features and Design Feature Effectiveness** 29

30 Required programmatic design features are described in Section A.2.2 of Appendix A
31 of this Final Solar PEIS. SEZ-specific species and habitats will determine how programmatic
32 design features are applied, for example:
33

- 34 • All dry wash and playa habitats within the SEZ shall be avoided to the
35 extent practicable, and any impacts should be minimized and mitigated in
36 consultation with appropriate agencies. A buffer area shall be maintained
37 around dry washes and playa habitats to reduce the potential for impacts.
38
- 39 • Appropriate engineering controls shall be used to minimize impacts on dry
40 wash, playa, and greasewood flat habitats, including downstream occurrences,
41 resulting from surface water runoff, erosion, sedimentation, altered hydrology,
42 accidental spills, or fugitive dust deposition to these habitats. Appropriate
43 buffers and engineering controls will be determined through agency
44 consultation.
45

- Groundwater studies shall be conducted to evaluate the potential for indirect impacts on springs located in the vicinity of the SEZ or those in hydrologically connected basins.

It is anticipated that implementation of these programmatic design features will reduce a high potential for impacts from invasive species and impacts on dry washes, playas, and springs to a minimal potential for impact.

On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of comments received as applicable, no SEZ-specific design features for vegetation have been identified. Some SEZ-specific design features may be identified through the process of preparing parcels for competitive offer and subsequent project-specific analysis.

13.3.11 Wildlife and Aquatic Biota

For the assessment of potential impacts on wildlife and aquatic biota, overall impact magnitude categories were based on professional judgment and include (1) *small*: a relatively small proportion ($\leq 1\%$) of the species' habitat within the SEZ region would be lost; (2) *moderate*: an intermediate proportion (> 1 but $\leq 10\%$) of the species' habitat would be lost; and (3) *large*: $> 10\%$ of the species' habitat would be lost.

13.3.11.1 Amphibians and Reptiles

13.3.11.1.1 Affected Environment

As presented in the Draft Solar PEIS, representative amphibian and reptile species expected to occur within the Wah Wah Valley SEZ include the Great Basin spadefoot (*Spea intermontana*), Great Plains toad (*Bufo cognatus*), sagebrush lizard (*Sceloporus graciosus*), desert horned lizard (*Phrynosoma platyrhinos*), eastern fence lizard (*S. undulatus*), gophersnake (*Pituophis catenifer*), greater short-horned lizard (*Phrynosoma hernandesi*), long-nosed leopard lizard (*Gambelia wislizenii*), nightsnake (*Hypsiglena torquata*), tiger whiptail (*Aspidoscelis tigris*), and wandering gartersnake (*Thamnophis elegans vagrans*, a subspecies of terrestrial gartersnake).

13.3.11.1.2 Impacts

As presented in the Draft Solar PEIS, solar energy development within the Wah Wah Valley SEZ could affect potentially suitable habitats for the representative amphibian and reptile species. The analysis presented in the Draft Solar PEIS indicated that development would result in a small overall impact on the representative amphibian and reptile species (Table 13.3.11.1-1 in the Draft Solar PEIS). The reduction in the developable area of the Wah Wah Valley SEZ

1 would result in reduced habitat impacts for all representative amphibian and reptile species; the
2 resultant impact levels for all the representative species would be small.

5 ***13.3.11.1.3 SEZ-Specific Design Features and Design Feature Effectiveness***

7 Required programmatic design features that would reduce impacts on amphibian and
8 reptile species are described in Section A.2.2 of Appendix A of this Final Solar PEIS. With the
9 implementation of required programmatic design features, impacts on amphibian and reptile
10 species will be reduced.

12 Because of changes to the developable areas within the SEZ boundaries, the SEZ-specific
13 design feature identified in the Draft Solar PEIS (i.e., the Wah Wah Wash should be avoided) is
14 no longer applicable. On the basis of impact analyses conducted for the Draft Solar PEIS and
15 consideration of comments received as applicable, no SEZ-specific design features for
16 amphibian and reptile species have been identified. Some SEZ-specific design features may be
17 identified through the process of preparing parcels for competitive offer and subsequent project-
18 specific analysis.

21 **13.3.11.2 Birds**

24 ***13.3.11.2.1 Affected Environment***

26 As presented in the Draft Solar PEIS, a large number of bird species could occur or have
27 potentially suitable habitat within the affected area of the proposed Wah Wah Valley SEZ.
28 Representative bird species identified in the Draft Solar PEIS included (1) passerines: Bewick's
29 wren (*Thryomanes bewickii*), Brewer's sparrow (*Spizella breweri*), common raven (*Corvus*
30 *corax*), gray flycatcher (*Empidonax wrightii*), greater roadrunner (*Geococcyx californianus*),
31 horned lark (*Eremophila alpestris*), Le Conte's thrasher (*Toxostoma leconteii*), loggerhead shrike
32 (*Lanius ludovicianus*), rock wren (*Salpinctes obsoletus*), sage sparrow (*Amphispiza belli*), sage
33 thrasher (*Oreoscoptes montanus*), vesper sparrow (*Pooecetes gramineus*), and western kingbird
34 (*Tyrannus verticalis*); (2) raptors: American kestrel (*Falco sparverius*), golden eagle (*Aquila*
35 *chrysaetos*), red-tailed hawk (*Buteo jamaicensis*), rough-legged hawk (*Buteo lagopus*, only
36 during winter), Swainson's hawk (*Buteo swainsoni*), and turkey vulture (*Cathartes aura*); and
37 (3) upland gamebirds: chukar (*Alectoris chukar*), mourning dove (*Zenaida macroura*), and wild
38 turkey (*Meleagris gallopavo*).

41 ***13.3.11.2.2 Impacts***

43 As presented in the Draft Solar PEIS, solar energy development within the Wah Wah
44 Valley SEZ could affect potentially suitable bird habitats. The analysis presented in the
45 Draft Solar PEIS indicated that development would result in a small overall impact on the
46 representative bird species (Table 13.3.11.2-1 in the Draft Solar PEIS). The reduction in the

1 developable area of the Wah Wah Valley SEZ would result in reduced habitat impacts for all
2 representative bird species; however, the resultant impact levels for all the representative bird
3 species would be small.

6 ***13.3.11.2.3 SEZ-Specific Design Features and Design Feature Effectiveness***

8 Required programmatic design features that would reduce impacts on bird species are
9 described in Section A.2.2 of Appendix A of this Final Solar PEIS. With implementation of
10 required programmatic design features and the applicable SEZ-specific design features, impacts
11 on bird species will be reduced.

13 Because of the reduction in the developable area within the SEZ, one of the SEZ-specific
14 design feature identified in Section 13.3.11.2.3 of the Draft Solar PEIS (i.e., the Wah Wah Wash
15 should be avoided) is no longer applicable. On the basis of impact analyses conducted for the
16 Draft Solar PEIS and consideration of comments received as applicable, the following SEZ-
17 specific design feature for bird species has been identified:

- 19 • The steps outlined in the *Utah Field Office Guidelines for Raptor Protection*
20 *from Human and Land Use Disturbances* (Romin and Muck 1999) should
21 be followed.

23 If SEZ-specific design features are implemented in addition to required programmatic
24 design features, impacts on bird species would be small. The need for additional SEZ-specific
25 design features will be identified through the process of preparing parcels for competitive offer
26 and subsequent project-specific analysis.

29 **13.3.11.3 Mammals**

32 ***13.3.11.3.1 Affected Environment***

34 As presented in the Draft Solar PEIS, a large number of mammal species were identified
35 that could occur or have potentially suitable habitat within the affected area of the proposed Wah
36 Wah Valley SEZ. Representative mammal species identified in the Draft Solar PEIS included
37 (1) big game species: American black bear (*Ursus americanus*), cougar (*Puma concolor*), elk
38 (*Cervis canadensis*), mule deer (*Odocoileus hemionus*), and pronghorn (*Antilocapra americana*);
39 (2) furbearers and small game species: American badger (*Taxidea taxus*), black-tailed jackrabbit
40 (*Lepus californicus*), coyote (*Canis latrans*), and desert cottontail (*Sylvilagus audubonii*); and
41 (3) small nongame species: desert woodrat (*Neotoma lepida*), Great Basin pocket mouse
42 (*Perognathus parvus*), least chipmunk (*Neotamias minimus*), northern grasshopper mouse
43 (*Onychomys leucogaster*), sagebrush vole (*Lemmiscus curtatus*), and white-tailed antelope
44 squirrel (*Ammospermophilus leucurus*). Bat species that may occur within the area of the SEZ
45 include the Brazilian free-tailed bat (*Tadarida brasiliensis*), little brown myotis (*Myotis*
46 *lucifugus*), long-legged myotis (*M. volans*), and western pipistrelle (*Parastrellus hesperus*).

1 However, roost sites for the bat species (e.g., caves, hollow trees, rock crevices, or buildings)
2 would be limited to absent within the SEZ.
3
4

5 ***13.3.11.3.2 Impacts*** 6

7 As presented in the Draft Solar PEIS, solar energy development within the Wah Wah
8 Valley SEZ could affect potentially suitable habitats of mammal species. The analysis presented
9 in the Draft Solar PEIS indicated that development would result in a small overall impact on the
10 representative mammal species (Table 13.3.11.3-1 in the Draft Solar PEIS). The reduction in the
11 developable area of the Wah Wah Valley SEZ would result in reduced habitat impacts for all
12 representative mammal species; resultant impact levels for all the representative mammal species
13 would be small. On the basis of mapped activity areas, direct potential loss of crucial pronghorn
14 range would be reduced from 4,878 acres (20 km²) to 4,698 acres (19 km²). No mapped cougar
15 habitat or crucial habitat for the other big game species occurs within the SEZ. Direct impact
16 levels for these big game mapped habitat areas would be small (pronghorn) to none (other big
17 game species).
18
19

20 ***13.3.11.3.3 SEZ-Specific Design Features and Design Feature Effectiveness*** 21

22 Required programmatic design features that would reduce impacts on mammal species
23 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. With the implementation
24 of required programmatic design features and the applicable SEZ-specific design feature,
25 impacts on mammal species will be reduced.
26

27 Because of changes in the developable area within the boundary of the SEZ, one of the
28 SEZ-specific design features identified in the Draft Solar PEIS (i.e., the Wah Wah Wash should
29 be avoided) is no longer applicable. On the basis of impact analyses conducted for the Draft
30 Solar PEIS and consideration of comments received as applicable, the following SEZ-specific
31 design feature for mammal species has been identified:
32

- 33 • The intermontane basin big sagebrush shrubland land cover type in the
34 southeastern portion of the SEZ, which is the only identified suitable land
35 cover type for the elk and sagebrush vole and about a third of the suitable
36 habitat for the American black bear in the SEZ, should be avoided.
37

38 If SEZ-specific design features are implemented in addition to required programmatic
39 design features, impacts on mammal species would be small. The need for additional
40 SEZ-specific design features will be identified through the process of preparing parcels for
41 competitive offer and subsequent project-specific analysis.
42
43

1 **13.3.11.4 Aquatic Biota**
2
3

4 ***13.3.11.4.1 Affected Environment***
5

6 No permanent water bodies or perennial streams occur within the boundaries of the Wah
7 Wah Valley SEZ. Because the boundaries of the Wah Wah Valley SEZ given in the Draft Solar
8 PEIS have not changed, the amount of surface water features within the area of direct and
9 indirect effects is still valid. Updates to the Draft Solar PEIS include the following:

- 10
11 • The 4-mi (6-km) segment of Wah Wah Wash located within the eastern
12 portion of the SEZ has been identified as a non-development area.
13
14 • The route of a new transmission line described in the Draft Solar PEIS is no
15 longer assumed.
16

17 Aquatic biota present in the surface water features in the Wah Wah Valley SEZ have not
18 been characterized. As stated in Appendix C of the Supplement to the Draft Solar PEIS, site
19 surveys can be conducted at the project-specific level to characterize the aquatic biota, if present,
20 in Wah Wah Wash.
21

22
23 ***13.3.11.4.2 Impacts***
24

25 The types of impacts from the development of utility-scale solar energy facilities that
26 could affect aquatic habitats and biota are discussed in Section 5.10.3 of the Draft Solar PEIS
27 and this Final Solar PEIS. Aquatic habitats could be affected by solar energy development in a
28 number of ways, including (1) direct disturbance, (2) deposition of sediments, (3) changes in
29 water quantity, and (4) degradation of water quality. The impact assessment provided in the
30 Draft Solar PEIS remains valid, with the following updates:

- 31
32 • The segment of Wah Wah Wash located within the SEZ has been identified as
33 a non-development area; therefore, construction activities would not directly
34 affect Wah Wah Wash. However, as described in the Draft Solar PEIS, Wah
35 Wah Wash could be affected indirectly by solar development activities within
36 the SEZ.
37
38 • The route of a new transmission line described in the Draft Solar PEIS is
39 no longer assumed; therefore the impacts on the Beaver River from the
40 transmission line crossing described in the Solar Draft PEIS are no longer
41 assumed to occur.
42
43
44

1 **13.3.11.4.3 SEZ-Specific Design Features and Design Feature Effectiveness**
2

3 Required programmatic design features that would reduce impacts on aquatic biota are
4 described in Section A.2.2 of Appendix A of this Final Solar PEIS. SEZ-specific resources and
5 conditions will guide how programmatic design features are applied, for example:
6

- 7 • Appropriate engineering controls shall be implemented to minimize the
8 amount of contaminants and sediment entering Wah Wah Wash.
9

10 It is anticipated that the implementation of the programmatic design features will reduce
11 impacts on aquatic biota, and if the utilization of water from groundwater or surface water
12 sources is adequately controlled to maintain sufficient water levels in nearby aquatic habitats, the
13 potential impacts on aquatic biota from solar energy development at the Wah Wah Valley SEZ
14 would be small.
15

16 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
17 comments received as applicable, no SEZ-specific design features for aquatic biota have been
18 identified. Some SEZ-specific design features may be identified through the process of preparing
19 parcels for competitive offer and subsequent project-specific analysis.
20
21

22 **13.3.12 Special Status Species**
23

24 **13.3.12.1 Affected Environment**
25
26

27 Twenty-two special status species were identified in the Draft Solar PEIS that could
28 occur or have potentially suitable habitat within the affected area of the proposed Wah Wah
29 Valley SEZ. The transmission assessment for the Wah Wah Valley SEZ has been updated,
30 and the specific route and land disturbance of a hypothetical transmission corridor are no longer
31 being assumed (see Section 13.3.23 for an updated transmission assessment for this SEZ). There
32 were no additional special status species identified that could occur in the SEZ affected area.
33 However, the reduction in the developable area of the Wah Wah Valley SEZ and elimination
34 of the analysis for the hypothetical transmission corridor reduces or eliminates the potential
35 for several species and their habitat to occur in the SEZ affected area. As presented in
36 Table 13.3.12.1-1 of the Draft Solar PEIS, special status species that were previously determined
37 to occur only outside of the SEZ within the assumed transmission corridor and area of indirect
38 effects include the following six species: (1) plants: Frisco buckwheat (*Eriogonum soredium*),
39 Frisco clover (*Trifolium friscanum*), Ostler's ivesia (*Ivesia Shockley ostleri*); (2) birds: greater
40 sage-grouse (*Centrocercus urophasianus*) and northern goshawk (*Accipiter gentilis*); and
41 (3) mammals: pygmy rabbit (*Brachylagus idahoensis*). With the elimination of the analysis for
42 the hypothetical transmission corridor, it is assumed that these six species have the potential to
43 occur only in the area of indirect effects of the Wah Wah Valley SEZ.
44

45 The previously assumed transmission corridor was determined to intersect approximately
46 5,800 acres (23 km²) of crucial brooding habitat for the greater sage-grouse. With the

1 elimination of analysis for the hypothetical transmission corridor, no crucial brooding habitat for
2 the greater sage-grouse is assumed to occur in the affected area of the Wah Wah Valley SEZ.
3
4

5 **13.3.12.2 Impacts**

6

7 Overall impact magnitude categories were based on professional judgment and include
8 (1) *small*: a relatively small proportion ($\leq 1\%$) of the special status species' habitat within the
9 SEZ region would be lost; (2) *moderate*: an intermediate proportion (>1 but $\leq 10\%$) of the special
10 status species' habitat would be lost; and (3) *large*: $\leq 10\%$ of the special status species' habitat
11 would be lost.
12

13 As presented in the Draft Solar PEIS, solar energy development within the Wah Wah
14 Valley SEZ could affect potentially suitable habitats of special status species. The analysis
15 presented in the Draft Solar PEIS for the original Wah Wah Valley SEZ developable area
16 indicated that development would result in no impact or a small overall impact on all special
17 status species (Table 13.3.12.1-1 in the Draft Solar PEIS). Development within the SEZ could
18 still affect the same 22 special status species evaluated in the Draft Solar PEIS; however, the
19 reduction in the developable area and elimination of the analysis for the hypothetical
20 transmission corridor would result in reduced (but still small) impact levels compared to
21 original estimates in the Draft Solar PEIS.
22

23 As presented in the Draft Solar PEIS, special status species that were previously
24 determined to only occur outside of the SEZ within the hypothetical transmission corridor and
25 area of indirect effects include the following six species: (1) plants: Frisco buckwheat, Frisco
26 clover, Ostler's ivesia; (2) birds: greater sage-grouse and northern goshawk; and (3) mammals:
27 pygmy rabbit. With the elimination of analysis for the hypothetical transmission corridor, it is
28 assumed that these six species have the potential to occur only in the area of indirect effects of
29 the Wah Wah Valley SEZ. Therefore, only indirect effects on these species are assumed to be
30 possible. Indirect impacts on these species are expected to be reduced to negligible levels with
31 the implementation of programmatic and SEZ-specific design features.
32
33

34 **13.3.12.3 SEZ-Specific Design Features and Design Feature Effectiveness**

35

36 Required programmatic design features are described in Section A.2.2 of Appendix A of
37 the Draft Solar PEIS. SEZ-specific resources and conditions will guide how programmatic
38 design features are applied, for example:
39

- 40 • Pre-disturbance surveys shall be conducted to determine the presence
41 and abundance of special status species, including those identified in
42 Table 13.3.12.1-1 of the Draft Solar PEIS. Disturbance to occupied habitats
43 for these species shall be avoided or impacts on occupied habitats minimized
44 to the extent practicable. If avoiding or minimizing impacts on occupied
45 habitats is not possible, translocation of individuals from areas of direct effect
46 or compensatory mitigation of direct effects on occupied habitats may be used

1 to reduce impacts. A comprehensive mitigation strategy for special status
2 species that uses one or more of these options to offset the impacts of
3 development shall be prepared in coordination with the appropriate federal
4 and state agencies.

- 5
- 6 • Consultations with the USFWS and the UDWR shall be conducted to address
7 the potential for impacts on the Utah prairie dog (*Cynomys parvidens*), a
8 species listed as threatened under the ESA. Consultation will identify an
9 appropriate survey protocol, avoidance measures, and, if appropriate,
10 reasonable and prudent alternatives, reasonable and prudent measures, and
11 terms and conditions for incidental take statements.
12
- 13 • Coordination with the USFWS and UDWR shall be conducted to address the
14 potential for impacts on the greater sage-grouse—a candidate species for
15 listing under the ESA. Coordination with the USFWS and UDWR shall also
16 be conducted for the following species that are under review for listing under
17 the ESA: Frisco buckwheat, Frisco clover, and Ostler’s pepper-grass.
18 Coordination with the USFWS and UDWR would identify an appropriate
19 pre-disturbance survey protocol, avoidance measures, and any potential
20 compensatory mitigation actions for each of these species.
21

22 It is anticipated that the implementation of these programmatic design features will
23 reduce the majority of impacts on the special status species from habitat disturbance and
24 groundwater use.
25

26 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
27 comments received as applicable, no SEZ-specific design features have been identified. Some
28 SEZ-specific design features may be identified through the process of preparing parcels for
29 competitive offer and subsequent project-specific analysis. Projects will comply with terms and
30 conditions set forth by the USFWS Biological Opinion resulting from programmatic consultation
31 and any necessary project-specific ESA Section 7 consultations.
32

33

34 **13.3.13 Air Quality and Climate**

35

36

37 **13.3.13.1 Affected Environment**

38

39 Except as noted below, the information for air quality and climate presented in the
40 affected environment section of the Draft Solar PEIS remains valid.
41

42

43 ***13.3.13.1.1 Existing Air Emissions***

44

45 The Draft Solar PEIS presented Beaver County emissions data for 2002. More recent data
46 for 2008 (UDEQ 2010) were reviewed. The two emissions inventories are from different sources

1 and assumptions. In the more recent data, emissions of SO₂, NO_x, CO, and VOCs were lower,
2 while PM₁₀ and PM_{2.5} emissions were higher. These changes would not affect modeled air
3 quality impacts presented in this update.
4

6 ***13.3.13.1.2 Air Quality***

7
8 The calendar quarterly average NAAQS of 1.5 µg/m³ for lead (Pb) presented in
9 Table 13.3.13.1-2 of the Draft Solar PEIS has been replaced by the rolling 3-month standard
10 (0.15 µg/m³). The federal 24-hour and annual SO₂, 1-hour O₃, and annual PM₁₀ standards have
11 been revoked as well (EPA 2011). Utah adopts the NAAQS; thus, Utah SAAQS will reflect the
12 same changes. These changes will not affect the modeled air quality impacts presented in this
13 update.
14

15 Because the boundaries of the proposed Wah Wah Valley SEZ have not changed, the
16 distances to the nearest Class I areas are the same as presented in the Draft Solar PEIS. There are
17 several Class I areas around the proposed Wah Wah Valley SEZ, none of which are situated
18 within 62 mi (100 km). The nearest Class I area is Zion NP, about 65 mi (105 km) south–
19 southeast of the SEZ, and the other nearby Class I areas include Bryce Canyon NP and Capital
20 Reef NP, about 85 mi (136 km) southeast and 105 mi (169 km) east–southeast of the SEZ,
21 respectively.
22

24 **13.3.13.2 Impacts**

27 ***13.3.13.2.1 Construction***

30 **Methods and Assumptions**

31
32 The methods and modeling assumptions remain the same as presented in the Draft Solar
33 PEIS. The area of the proposed Wah Wah Valley SEZ was reduced by less than 4%, from
34 6,097 acres (24.7 km²) to 5,873 acres (23.8 km²). This small reduction would have a negligible
35 impact on air quality; thus, impacts were not remodeled.
36
37

38 **Results**

39
40 Because the annual PM₁₀ standard has been rescinded, the discussion of annual PM₁₀
41 impacts in the Draft Solar PEIS is no longer applicable, and Table 13.3.13.2-1 has been updated
42 for this Final Solar PEIS. The tabulated concentrations as presented in the Draft Solar PEIS
43 remain valid.
44
45

1 **TABLE 13.3.13.2-1 Maximum Air Quality Impacts from Emissions Associated with Construction**
 2 **Activities for the Proposed Wah Wah Valley SEZ as Revised**

Pollutant ^a	Averaging Time	Rank ^b	Concentration ($\mu\text{g}/\text{m}^3$)				Percentage of NAAQS	
			Maximum Increment ^b	Background ^c	Total	NAAQS	Increment	Total
PM ₁₀	24-hour	H6H	576	83	659	150	384	439
PM _{2.5}	24-hour	H8H	42.0	18	60.0	35	120	171
	Annual	NA ^d	8.8	8	16.8	15	58	112

a PM_{2.5} = particulate matter with a diameter of $\leq 2.5 \mu\text{m}$; PM₁₀ = particulate matter with a diameter of $\leq 10 \mu\text{m}$.

b Concentrations for attainment demonstration are presented. H6H = highest of the sixth-highest concentrations at each receptor over the 5-year period. H8H = highest of the multiyear average of the eighth-highest concentrations at each receptor over the 5-year period. For the annual average, multiyear averages of annual means over the 5-year period are presented. Maximum concentrations are predicted to occur at the site boundaries.

c See Table 13.3.13.1-2 of the Draft Solar PEIS (Prey 2009).

d NA = not applicable.

17
18
19

Because the air quality impacts remain the same as those presented in the Draft Solar PEIS, the conclusions presented there remain valid.² Predicted 24-hour PM₁₀ and 24-hour and annual PM_{2.5} concentration levels could exceed the standard levels used for comparison at the SEZ boundaries and in the immediate surrounding areas during the construction of solar facilities. To reduce potential impacts on ambient air quality and in compliance with programmatic design features, aggressive dust control measures would be used.

At the nearest residence located adjacent to the northern boundary of the SEZ, the predicted maximum 24-hour concentration increment from construction activities is about 353 $\mu\text{g}/\text{m}^3$, above the standard level used for comparison, and the predicted maximum 24-hour and annual PM_{2.5} concentration increments would be about 28 and 5.1 $\mu\text{g}/\text{m}^3$, respectively.

Modeling indicates that emissions from construction activities are not anticipated to exceed Class I PSD PM₁₀ increments at the nearest federal Class I area (Zion NP). Construction activities are not subject to the PSD program, and the comparison provides only a screen to

² At this programmatic level, detailed information on construction activities, such as facility size, type of solar technology, heavy equipment fleet, activity level, work schedule, and so on, is not known; thus air quality modeling cannot be conducted. It has been assumed that an area of 3,000 acres (12.1 km²) in total would be disturbed continuously; thus the modeling results and discussion here should be interpreted in that context. During the site-specific project phase, more detailed information would be available and more realistic air quality modeling analysis could be conducted. It is likely that impacts on ambient air quality predicted for specific projects would be much lower than those presented in this Final Solar PEIS.

1 gauge the size of the impact. Overall, it is anticipated that impacts of construction activities on
2 ambient air quality would be moderate and temporary.

3
4 Because the same area is assumed to be disturbed in the Draft Solar PEIS and this Final
5 Solar PEIS, emissions from construction equipment and vehicles would be the same as those
6 discussed in the Draft Solar PEIS and the conclusions of the Draft Solar PEIS remain valid.
7 Construction emissions from the engine exhaust from heavy equipment and vehicles could cause
8 impacts on AQRVs (e.g., visibility and acid deposition) at the nearest federal Class I area, Zion
9 NP, which is not located directly downwind of prevailing winds. Construction-related emissions
10 are temporary and thus would cause some unavoidable but short-term impacts.

11 12 13 ***13.3.13.2.2 Operations***

14
15 The change in the developable area of the proposed Wah Wah Valley SEZ by less than
16 4%, from 6,097 acres (24.7 km²) to 5,873 acres (23.8 km²), reduces the generating capacity and
17 annual power generation and thus reduces the potentially avoided emissions presented in the
18 Draft Solar PEIS. Total revised power generation capacity ranging from 522 to 940 MW is
19 estimated for the Wah Wah Valley SEZ for various solar technologies. As explained in the Draft
20 Solar PEIS, the estimated amount of emissions avoided for the solar technologies evaluated
21 depends only on the megawatts of conventional fossil fuel-generated power avoided.

22
23 Table 13.3.13.2-2 in the Draft Solar PEIS provided estimates for emissions potentially
24 avoided by a solar facility. Those estimates were updated by reducing the tabulated estimates by
25 3.68%, as shown in the revised Table 13.3.13.2-2. For example, for the technologies estimated
26 to require 9 acres/MW (power tower, dish engine, and PV), up to 1,741 tons of NO_x per year
27 (= 96.32% × the value of 1,807 tons per year tabulated in the Draft Solar PEIS) could be avoided
28 by full solar development of the proposed Wah Wah Valley SEZ as revised for this Final Solar
29 PEIS. Because the total emissions potentially avoided by full solar development of the proposed
30 Wah Wah Valley SEZ are about the same as those presented in the Draft Solar PEIS, the
31 conclusions of the Draft Solar PEIS remain valid. Full solar development of the proposed Wah
32 Wah Valley SEZ could result in substantial avoided emissions. Solar facilities to be built in the
33 Wah Wah Valley SEZ could avoid relatively more fossil fuel emissions than those built in other
34 states that rely less on fossil fuel-generated power.

35 36 37 ***13.3.13.2.3 Decommissioning and Reclamation***

38
39 The discussion in the Draft Solar PEIS remains valid. Decommissioning and reclamation
40 activities would be of short duration, and their potential air impacts would be moderate and
41 temporary.

1 **TABLE 13.3.13.2-2 Annual Emissions from Combustion-Related Power Generation Avoided by**
 2 **Full Solar Development of the Proposed Wah Wah Valley SEZ as Revised**

Area Size (acres) ^a	Capacity (MW) ^b	Power Generation (GWh/yr) ^c	Emissions Avoided (tons/yr; 10 ³ tons/yr for CO ₂) ^d			
			SO ₂	NO _x	Hg	CO ₂
5,873	522–940	915–1,646	910–1,638	1,741–3,133	0.004–0.006	987–1,776
Percentage of total emissions from electric power systems in the state of Utah ^e			2.5-4.4%	2.5-4.4%	2.5-4.4%	2.5-4.4%
Percentage of total emissions from all source categories in the state of Utah ^f			1.7–3.0%	0.71–1.3%	– ^g	1.4-2.4%
Percentage of total emissions from electric power systems in the six-state study area ^e			0.36–0.65%	0.47–0.85%	0.12–0.22%	0.38–0.68%
Percentage of total emissions from all source categories in the six-state study area ^f			0.19–0.35%	0.06–0.12%	–	0.12–0.21%

^a To convert acres to km², multiply by 0.004047.
^b It is assumed that the SEZ would eventually have development on 80% of the lands and that a range of 5 acres (0.020 km²) per MW (for parabolic trough technology) to 9 acres (0.036 km²) per MW (power tower, dish engine, and PV technologies) would be required.
^c A capacity factor of 20% is assumed.
^d Composite combustion-related emission factors for SO₂, NO_x, Hg, and CO₂ of 1.99, 3.81, 7.8 × 10⁻⁶, and 2,158 lb/MWh, respectively, were used for the state of Utah.
^e Emission data for all air pollutants are for 2005.
^f Emission data for SO₂ and NO_x are for 2002, while those for CO₂ are for 2005.
^g NA = not estimated.

Sources: EPA (2009a,b); WRAP (2009).

3
 4
 5 **13.3.13.3 SEZ-Specific Design Features and Design Feature Effectiveness**
 6

7 Required programmatic design features that would reduce air quality impacts are
 8 described in Section A.2.2 of Appendix A of this Final Solar PEIS. Limiting dust generation
 9 during construction and operations is a required programmatic design feature under the BLM
 10 Solar Energy Program. These extensive fugitive dust control measures would keep off-site PM
 11 levels as low as possible during construction.

12
 13 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
 14 comments received as applicable, no SEZ-specific design features for air quality have been
 15 identified. Some SEZ-specific design features may be identified through the process of preparing
 16 parcels for competitive offer and subsequent project-specific analysis.

1 **13.3.14 Visual Resources**

2
3
4 **13.3.14.1 Affected Environment**

5
6 No boundary revisions were identified for the proposed Wah Wah Valley SEZ in the
7 Supplement to the Draft Solar PEIS; however, 224 acres (0.91 km²) of Wah Wah Wash was
8 identified as a non-development area. The remaining developable area within the SEZ is
9 5,873 acres (23.8 km²).

10
11
12 **13.3.14.2 Impacts**

13
14 The summary of impacts provided in the Draft Solar PEIS remains valid, as follows.
15 The SEZ is in an area of low scenic quality. Residents, workers, and visitors to the area may
16 experience visual impacts from solar energy facilities located within the SEZ (as well as any
17 associated access roads and transmission lines) as they travel area roads. The residents nearest to
18 the SEZ could be subjected to large visual impacts from solar energy development within the
19 SEZ. State Route 21 passes through the SEZ, and travelers on that road could be subjected to
20 very strong visual contrasts from solar development within the SEZ, but typically their exposure
21 would be brief.

22
23 Utility-scale solar energy development within the proposed Wah Wah Valley SEZ could
24 cause moderate levels of visual contrast as observed from the Wah Wah Mountains WSA at
25 distances between 5 and 10 mi (8 and 16 km) from the SEZ. A very small portion of the King
26 Top WSA is within the viewshed of the SEZ, but it is too far away to be affected significantly by
27 visual impacts resulting from solar development within the SEZ. The closest community is more
28 than 25 mi (40 km) from the SEZ, and therefore is likely to experience minimal or no visual
29 impacts from solar development within the SEZ.

30
31
32 **13.3.14.3 SEZ-Specific Design Features and Design Feature Effectiveness**

33
34 Required programmatic design features that would reduce impacts on visual resources
35 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. While application of the
36 programmatic design features would reduce potential visual impacts somewhat, the degree of
37 effectiveness of these design features can only be assessed at the site- and project-specific level.
38 Given the large scale, reflective surfaces, and strong regular geometry of utility-scale solar
39 energy facilities and the lack of screening vegetation and landforms within the SEZ viewshed,
40 siting the facilities away from sensitive visual resource areas and other sensitive viewing areas
41 would be the primary means of mitigating visual impacts. The effectiveness of other visual
42 impact mitigation measures generally would be limited.

43
44 On the basis of the impact analyses conducted for the Draft Solar PEIS and consideration
45 of comments received as applicable, no SEZ-specific design features for visual resources have
46 been identified in this Final Solar PEIS. Some SEZ-specific design features may be identified

1 through the process of preparing parcels for competitive offer and subsequent project-specific
2 analysis.

3 4 5 **13.3.15 Acoustic Environment**

6 7 8 **13.3.15.1 Affected Environment**

9
10 The developable area of the proposed Wah Wah Valley SEZ was reduced by less than
11 4%, from 6,097 acres (24.7 km²) to 5,873 acres (23.8 km²). The boundaries of the SEZ were not
12 changed; thus the information for acoustic environment remains the same as presented in the
13 Draft Solar PEIS.

14 15 16 **13.3.15.2 Impacts**

17
18 The small reduction in the developable area of the SEZ would cause only a negligible
19 reduction in predicted noise levels from construction and operations. The conclusions presented
20 in the Draft Solar PEIS remain valid.

21 22 23 ***13.3.15.2.1 Construction***

24
25 The conclusions in the Draft Solar PEIS remain valid. For construction activities
26 occurring near the northern SEZ boundary, estimated noise levels at the nearest residence
27 (adjacent to the northern SEZ boundary) would be about 74 dBA, which is above the
28 neighboring Iron County regulation level of 50 dBA and above a typical daytime mean rural
29 background level of 40 dBA. The estimated 70 dBA L_{dn} at the residence is well above the EPA
30 guideline of 55 dBA L_{dn} for residential areas.

31
32 No specially designated areas are within 5 mi (8 km) of the Wah Wah Valley SEZ, which
33 is the farthest distance at which noise, other than extremely loud noise, would be discernible.
34 Thus, no noise impact analysis for specially designated areas was conducted.

35
36 Construction at the Wah Wah Valley SEZ would cause negligible impacts on nearby
37 communities because of considerable separation distances. However, for activities occurring near
38 the northern SEZ boundary, construction would cause unavoidable but localized short-term noise
39 impacts on the nearest residence.

40
41 No adverse vibration impacts are anticipated from construction activities except for pile
42 driving, which could affect the nearest residence when it occurs near the residence along the
43 northern border of the SEZ.

1 **13.3.15.2.2 Operations**

2
3 Because of the small reduction in developable area, conclusions presented in the Draft
4 Solar PEIS remain valid.

5
6
7 **Parabolic Trough and Power Tower**

8
9 For operating parabolic trough and power tower technologies along the northern
10 boundary of the SEZ, the predicted noise level would be about 51 dBA at the nearest residence;
11 this noise level is comparable to the neighboring Iron County regulation of 50 dBA and above
12 the typical daytime mean rural background level of 40 dBA. If TES were not used, the EPA
13 guideline level of 55 dBA L_{dn} would not be exceeded outside the SEZ boundary, including at the
14 nearest residence. If TES were used, the estimated nighttime noise level at the nearest residence
15 would be about 61 dBA, higher than both the neighboring Iron County regulation of 50 dBA and
16 the typical nighttime mean rural background level of 30 dBA. The day-night average noise level
17 would be about 63 dBA L_{dn} , higher than the EPA guideline of 55 dBA L_{dn} for residential areas.
18 Thus, operating parabolic trough or power tower facilities using TES and located near the
19 northern SEZ boundary could result in adverse noise impacts on the nearest residence, depending
20 on background noise levels and meteorological conditions. In the permitting process, refined
21 noise propagation modeling would be warranted along with measurement of background noise
22 levels.

23
24
25 **Dish Engines**

26
27 For operating dish engine facilities, the estimated noise level at the nearest residence
28 adjacent to the northern boundary would be about 58 dBA, above both the neighboring Iron
29 County regulation level of 50 dBA and the typical daytime mean rural background level of
30 40 dBA. For 12-hour daytime operations, the estimated 55 dBA L_{dn} at the residence is
31 equivalent to the EPA guideline for residential areas. Thus, a dish engine facility near the
32 northern SEZ boundary, close to the nearest residence, could result in adverse impacts on the
33 residence, depending on background noise levels and meteorological conditions. Consideration
34 of minimizing noise impacts is very important in the siting of dish engine facilities. Direct
35 mitigation of dish engine noise through noise control engineering could also limit noise impacts.

36
37 During operation of any solar facility, potential vibration impacts on surrounding
38 communities and vibration-sensitive structures would be minimal.

39
40 The discussions of vibration, transformer and switchyard noise, and transmission line
41 corona discharge presented in the Draft Solar PEIS remain valid. Noise impacts from these
42 sources would be minimal to negligible.

1 **13.3.15.2.3 Decommissioning and Reclamation**

2
3 The discussion in the Draft Solar PEIS remains valid. Decommissioning and reclamation
4 activities would be of short duration, and their potential noise impacts would be minor and
5 temporary. Potential vibration impacts on surrounding communities and vibration-sensitive
6 structures would be minimal.

7
8
9 **13.3.15.3 SEZ-Specific Design Features and Design Feature Effectiveness**

10
11 Required programmatic design features that would reduce noise impacts are described in
12 Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the programmatic design
13 features will provide some protection from noise impacts.

14
15 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
16 comments received as applicable, no SEZ-specific design features were identified for noise.
17 Some SEZ-specific design features may be identified through the process of preparing parcels
18 for competitive offer and subsequent project-specific analysis.

19
20
21 **13.3.16 Paleontological Resources**

22
23
24 **13.3.16.1 Affected Environment**

25
26 Data provided in the Draft Solar PEIS remain valid, with the following update:

- 27
28 • The BLM Regional Paleontologist may have additional information regarding
29 the paleontological potential of the SEZ and be able to verify the PFYC of the
30 SEZ as Class 2 as used in the Draft Solar PEIS.

31
32
33 **13.3.16.2 Impacts**

34
35 Few, if any, impacts on significant paleontological resources are likely to occur in the
36 proposed Wah Wah Valley SEZ. However, a more detailed look at the geological deposits of the
37 SEZ is needed to determine whether a paleontological survey is warranted. The assessment
38 provided in the Draft Solar PEIS remains valid.

39
40
41 **13.3.16.3 SEZ-Specific Design Features and Design Feature Effectiveness**

42
43 Required programmatic design features that would reduce impacts on paleontological
44 resources are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Impacts would
45 be minimized through the implementation of required programmatic design features, including a

1 stop-work stipulation in the event that paleontological resources are encountered during
2 construction, as described in Section A.2.2 of Appendix A.

3
4 On the basis of impact analyses conducted for the Draft Solar PEIS, and consideration of
5 comments received as applicable, no SEZ-specific design features for paleontological resources
6 have been identified. If the geological deposits are determined to be as described above and
7 remain classified as PFYC Classes 1 and 2, SEZ-specific design features for mitigating impacts
8 on paleontological resources within the Wah Wah Valley SEZ and associated ROWs are not
9 likely to be necessary. Therefore, the need for and nature of any SEZ-specific design features for
10 the SEZ would depend on the results of future paleontological investigations. Some SEZ-specific
11 design features may be identified through the process of preparing parcels for competitive offer
12 and subsequent project specific analysis.

13
14 As additional information on paleontological resources (e.g., from regional
15 paleontologists or from new surveys) becomes available, the BLM will post the data on the
16 project Web site (<http://solareis.anl.gov>) for use by applicants, the BLM, and other stakeholders.

17 18 19 **13.3.17 Cultural Resources**

20 21 22 **13.3.17.1 Affected Environment**

23
24 Data provided in the Draft Solar PEIS remain valid, with the following updates:

- 25
26 • A tribally approved ethnographic study of the proposed Wah Wah Valley SEZ
27 was conducted (SWCA and University of Arizona 2011), and a summary of
28 that study was presented in the Supplement to the Draft Solar PEIS. New
29 cultural landscapes, important water sources, and traditional plants and
30 animals were identified (see Section 13.3.18 for a description of the latter).
31 The completed ethnographic study is available in its entirety on the Solar
32 PEIS Web site (<http://solarpeis.anl.gov>).
- 33
34 • Tribal representatives of the Confederated Tribes of the Goshute Reservation
35 and the Paiute Indian Tribe of Utah stated that the Wah Wah Valley is part of
36 a large ceremonial landscape that includes important geological features, such
37 as the Wah Wah Mountains, Wallaces Peak, Wah Wah Springs, Seiver Lake,
38 and important volcanic features.
- 39
40 • Additional information may be available to characterize the area surrounding
41 the proposed SEZ in the future (after the Final Solar PEIS is completed), as
42 follows:
 - 43 – Results of a Class I literature file search to better understand (1) the site
44 distribution pattern in the vicinity of the SEZ, (2) potential trail networks
45 through existing ethnographic reports, and (3) overall cultural sensitivity
46 of the landscape.

- 1 – Results of a Class II reconnaissance-level stratified random sample survey
2 of the SEZ with a goal of achieving a 10% sample (roughly 587 acres
3 [2.38 km²]) as funding to support additional Class II sample inventories in
4 the SEZ areas becomes available. Areas of interest, such as dune areas and
5 along washes, as determined through a Class I review, should also be
6 identified prior to establishing the survey design and sampling strategy.
7 If appropriate, some subsurface testing of dune and/or colluvium areas
8 should be considered in the sampling strategies for future surveys. The
9 sample inventory combined with the Class I review would be used to
10 project cultural sensitivity zones as an aid in planning future solar
11 developments.
- 12 – Continuation of government-to-government consultation as described in
13 Section 2.4.3 of the Supplement to the Draft Solar PEIS and IM 2012-032
14 (BLM 2011c), including follow-up to recent ethnographic studies with
15 tribes not included in the original studies to determine whether those tribes
16 have similar concerns.

17 18 19 **13.3.17.2 Impacts**

20
21 As stated in the Draft Solar PEIS, direct impacts on significant cultural resources could
22 occur in the proposed Wah Wah Valley SEZ. The potential for impacts on cultural resources is
23 believed to be low; however, further investigation is needed.

24 25 26 **13.3.17.3 SEZ-Specific Design Features and Design Feature Effectiveness**

27
28 Required programmatic design features that would reduce impacts on cultural resources
29 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Programmatic design
30 features assume that the necessary surveys, evaluations, and consultations will occur.

31
32 On the basis of impact analyses conducted for the Draft Solar PEIS, consideration of
33 comments received as applicable, and a review of the ethnographic report, no SEZ-specific
34 design features for cultural resources have been identified. SEZ-specific design features would
35 be determined in consultation with the Utah SHPO and affected tribes and would depend on the
36 results of future investigations. Some SEZ-specific design features may be identified through the
37 process of preparing parcels for competitive offer and subsequent project-specific analysis.

38 39 40 **13.3.18 Native American Concerns**

41 42 43 **13.3.18.1 Affected Environment**

44
45 Data provided in the Draft Solar PEIS remain valid, with the following updates:
46

- 1 • A tribally approved ethnographic study of the proposed Wah Wah Valley SEZ
2 was conducted (SWCA and University of Arizona 2011), and a summary of
3 that study was presented in the Supplement to the Draft Solar PEIS. New
4 cultural landscapes, important water sources, and traditional plants and
5 animals were identified. The completed ethnographic study is available in
6 its entirety on the Solar PEIS Web site (<http://solarpeis.anl.gov>).
7
- 8 • Tribal representatives from both the Confederated Tribes of the Goshute
9 Reservation and the Paiute Indian Tribe of Utah believe that all the cultural
10 resources and landscapes within the proposed Wah Wah Valley SEZ are
11 important in helping both tribes understand their past, present, and future.
12
- 13 • Matters of particular concern to the representatives of the Confederated Tribes
14 of the Goshute Reservation are the amount of light that will be reflected off
15 solar panels and the loss of *Puha* (power) that may occur, interfering with
16 prayer and distracting individuals who come to the area to receive a vision;
17 the amount of water needed to sustain a solar energy plant; and the effect on
18 plant and animal life from using a lot of water.
19
- 20 • Tribal representatives of the Confederated Tribes of the Goshute Reservation
21 and the Paiute Indian Tribe of Utah believe the area including and surrounding
22 the proposed Wah Wah Valley SEZ should be managed as a spiritual cultural
23 landscape and that significant areas (e.g., Wah Wah Springs, Sevier Lake,
24 Pleistocene Lake Bonneville, the Wah Wah Mountains, and Wallaces Peak)
25 should be nominated as traditional cultural properties.
26
- 27 • Wah Wah Springs, Sevier Lake, and Lake Bonneville have been identified as
28 important sources of water to the tribes. Wah Wah Springs was identified as
29 an important place of ceremonial, spiritual, and healing activity.
30
- 31 • The Wah Wah Mountains and Wallaces Peak have been identified as
32 important ceremonial and spiritual locations often used for prayer and vision
33 questing.
34
- 35 • Indian Graves Peak was identified as the location of Native American burials.
36
- 37 • Fields of Indian ricegrass have been identified as “traditional crops actively
38 managed and cared for by Indian people” (SWCA and University of Arizona
39 2011). Tribal representatives have expressed interest in traditionally managing
40 and harvesting these fields.
41
- 42 • Areas that contain evidence of volcanic activity have been identified as
43 culturally important parts of the landscape.
44
- 45 • Several historic events in and around the Escalante Valley have contributed to
46 the history of both tribes. These include the period of European contact,

1 travel, and exploration, which greatly reduced the Goshute and Paiute
2 traditional use areas (i.e., the establishment of the Old Spanish Trail; the
3 influx of Mormon settlers, and the forty-niner gold rush); the spread of
4 European diseases, which decimated Native American populations; the
5 U.S. Military Conflict of 1863; the forced abandonment of the tribal
6 horticultural way of life into a herding and ranching lifestyle; and the
7 establishment of mines and mining communities in which Native Americans
8 were employed.
9

- 10 • The following traditional plants have been identified in addition to those listed
11 in Table 13.3.18.1-2 of the Draft Solar PEIS: banana yucca (*Yucca baccata*),
12 big sagebrush (*Artemisia tridentata*), black sagebrush (*Artemisia nova*), broom
13 snakeweed (*Gutierrezia sorothrae*), buckbrush (*Purshia glandulosa*), bud
14 sagebrush (*Picrothamnus desertorum*), desert globemallow (*Sphaeralcea*
15 *ambigua*), desert saltbush (*Atriplex polycarpa*), fishhook cactus (*Escobaria*
16 *vivipara*), Great Basin gishook cactus (*Sclerocactus pubispinus*), hairspine
17 pricklypear (*Opuntia polyacantha*), hedgehog cactus (*Echinocereus*), Mexican
18 cliffrose (*Purshia Mexicana*), Nevada Indian tea (*Ephedra nevadensis*),
19 orange linchen (*Caloplaca trachyphylla*), ryegrass (*Elymus*), sedge
20 (*Carex* sp.), Spanish bayonet (*Yucca harrimaniae*), Utah juniper
21 (*Juniperus osteoperma*), watercress (*Nasturtium officinale*), and wild
22 carrot (*Lepidium* sp.).
23
- 24 • The following traditional animals have been identified in addition to those
25 listed in Table 13.3.18.1-3 of the Draft Solar PEIS: American black bear
26 (*Ursus americanus*), American badger (*Taxidea taxus*), cougar (*Puma*
27 *concolor*), elk (*Cervis Canadensis*), American kestrel (*Falco sparverius*),
28 greater roadrunner (*Geococcyx californianus*), loggerhead shrike (*Lanius*
29 *ludovicianus*), rock wren (*Salpinctes obsoletus*), turkey vulture (*Cathartes*
30 *aura*), western kingbird (*Tyrannus verticalis*), dragonfly (suborder
31 Anisoptera), and red ants (family Formicidae).
32
33

34 13.3.18.2 Impacts 35

36 The description of potential concerns provided in the Draft Solar PEIS remains valid.
37 During past project-related consultation, the Southern Paiutes and Western Shoshone have
38 expressed concern over project impacts on a variety of resources. Potential impacts could occur
39 on important resources such as food plants, medicinal plants, plants used in basketry, plants used
40 in construction, large and small game animals, birds, and sources of clay, salt, and pigments
41 (Stoffle and Dobyms 1983). The construction of utility-scale energy facilities within the proposed
42 SEZ would result in the destruction of some plants important to Native Americans and the
43 habitat of some traditionally important animals.
44

45 In addition to the impacts discussed in the Draft Solar PEIS, the ethnographic study
46 conducted for the proposed Wah Wah Valley SEZ identified the following impacts:

- 1 • Tribal representatives believe that solar energy development within the
2 proposed Wah Wah Valley SEZ will adversely affect water sources, culturally
3 important geological features, and traditional plant, mineral, and animal
4 resources (SWCA and University of Arizona 2011).
5
- 6 • Development within the proposed Wah Wah Valley SEZ may affect the
7 spiritual connection both tribes have to water and magma, through *Puha*,
8 especially for developments near spiritual water sources, such as Wah Wah
9 Springs, and any prominent volcanic feature located within the SEZ.
10
- 11 • Development within the proposed Wah Wah Valley SEZ will directly affect
12 culturally important plant and animal resources, because it will likely require
13 the grading of the project area.
14

16 **13.3.18.3 SEZ-Specific Design Features and Design Feature Effectiveness**

17
18 Required programmatic design features that would reduce impacts on Native Americans
19 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. For example, impacts
20 would be minimized through the avoidance of sacred sites, water sources, and tribally important
21 plant and animal species. Programmatic design features assume that the necessary surveys,
22 evaluations, and consultations will occur. The tribes would be notified regarding the results of
23 archaeology surveys, and they would be contacted immediately upon any discovery of Native
24 American human remains and associated cultural items.
25

26 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
27 comments received as applicable, the following SEZ-specific design feature to address Native
28 American concerns has been identified:
29

- 30 • Compensatory programs of mitigation could be implemented to provide
31 access to and/or deliberately cultivate patches of culturally significant plants,
32 like the Indian ricegrass fields present within the Wah Wah Valley SEZ, on
33 other public lands nearby where tribes have ready access.
34

35 The need for and nature of additional SEZ-specific design features regarding potential
36 issues of concern would be determined during government-to-government consultation with
37 affected tribes as part of the process of preparing parcels for competitive offer and subsequent
38 project specific analysis. Potentially significant sites and landscapes in the vicinity of the SEZ
39 associated with Wah Wah Springs, Sevier Lake, Lake Bonneville, Wah Wah Mountains,
40 Wallaces Peak, and the Wasatch Mountains, as well as important water sources, ceremonial
41 areas, and traditionally important plant and animal species, should be considered and discussed
42 during consultation.
43
44
45

1 **13.3.19 Socioeconomics**

2
3
4 **13.3.19.1 Affected Environment**

5
6 The boundaries of the Wah Wah Valley SEZ have not changed. The socioeconomic ROI,
7 the area in which site employees would live and spend their wages and salaries and into which
8 any in-migration would occur, includes the same counties and communities as described in the
9 Draft Solar PEIS, meaning that no updates to the affected environment information given in the
10 Draft Solar PEIS are required.

11
12
13 **13.3.19.2 Impacts**

14
15 Socioeconomic resources in the ROI around the SEZ could be affected by solar energy
16 development through the creation of direct and indirect employment and income, the generation
17 of direct sales and income taxes, SEZ acreage rental and capacity payments to the BLM, the
18 in-migration of solar facility workers and their families, and impacts on local housing markets
19 and on local community service employment. Since the boundaries of the proposed Wah Wah
20 Valley SEZ remain unchanged and the reduction of the developable area was small (less
21 than 4%), the impacts of full build-out of the SEZ estimated in the Draft Solar PEIS remain
22 essentially unchanged. During construction, between 213 and 2,817 jobs and between
23 \$11.2 million and \$148 million in income could be associated with solar development in the
24 SEZ. During operations at full build-out, between 14 and 316 jobs and between \$0.4 million
25 and \$9.7 million in income could be produced. In-migration of workers and their families
26 would mean between 48 and 631 rental housing units would be needed during construction,
27 and between 4 and 81 owner-occupied units during operations.

28
29
30 **13.3.19.3 SEZ-Specific Design Features and Design Feature Effectiveness**

31
32 Required programmatic design features that would reduce socioeconomic impacts
33 are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the
34 programmatic design features will reduce the potential for socioeconomic impacts during all
35 project phases.

36
37 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
38 comments received as applicable, no SEZ-specific design features to address socioeconomic
39 impacts have been identified. Some SEZ-specific design features may be identified through the
40 process of preparing parcels for competitive offer and subsequent project-specific analysis.

1 **13.3.20 Environmental Justice**

2
3
4 **13.3.20.1 Affected Environment**

5
6 The data presented in the Draft Solar PEIS have not changed substantially for the
7 proposed Wah Wah Valley SEZ. There are no minority or low-income populations in the Nevada
8 or Utah portions of the 50-mi (80-km) radius of the SEZ taken as a whole. At the individual
9 block group level, there are low-income populations in specific census block groups located in
10 two block groups in Iron County, in Cedar City itself, and to the west of Cedar City.
11

12
13 **13.3.20.2 Impacts**

14
15 Potential impacts (e.g., from noise and dust during construction and operations, visual
16 impacts, cultural impacts, and effects on property values) on low-income and minority
17 populations could be incurred as a result of the construction and operation of solar facilities
18 involving each of the four technologies. Impacts are likely to be small, and there are no minority
19 populations defined by CEQ guidelines (CEQ 1997) (see Section 13.3.20.1 of the Draft Solar
20 PEIS) within the 50-mi (80-km) radius around the boundary of the SEZ. This means that any
21 adverse impacts of solar projects would not disproportionately affect minority populations.
22 Because there are no low-income populations within the 50-mi (80-km) radius as a whole, there
23 would be no impacts on low-income populations.
24
25

26 **13.3.20.3 SEZ-Specific Design Features and Design Feature Effectiveness**

27
28 Required programmatic design features that would reduce potential environmental justice
29 impacts are described in Section A.2.2 of Appendix A of this Final Solar PEIS. Implementing the
30 programmatic design features will reduce the potential for such impacts.
31

32 On the basis of impact analyses conducted for the Draft Solar PEIS, and consideration of
33 comments received as applicable, no SEZ-specific design features for environmental justice
34 impacts have been identified. Some SEZ-specific design features may be identified through the
35 process of preparing parcels for competitive offer and subsequent project-specific analysis.
36
37

38 **13.3.21 Transportation**

39
40
41 **13.3.21.1 Affected Environment**

42
43 The reduction in developable area of the proposed Wah Wah Valley SEZ of less than 4%
44 does not change the information on affected environment provided in the Draft Solar PEIS.
45
46

1 **13.3.21.2 Impacts**
2

3 As stated in the Draft Solar PEIS, the primary transportation impacts are anticipated to
4 be from commuting worker traffic. Single projects could involve up to 1,000 workers each day,
5 with an additional 2,000 vehicle trips per day (maximum). The volume of traffic on State
6 Route 21 and other regional corridors would be more than double the current values near the
7 SEZ. Local road improvements would be necessary on any portion of State Route 21 that might
8 be developed so as not to overwhelm the local access roads near any site access point(s).
9 Depending on the locations of the worker population, roads connecting to State Route 21 may
10 also require upgrades (e.g., State Route 130). Potential existing site access roads would require
11 improvements, including asphalt pavement.
12

13 Solar development within the SEZ would affect public access along OHV routes that
14 are designated open and available for public use. Although open routes crossing areas granted
15 ROWs for solar facilities could be redesignated as closed (see Section 5.5.1 of the Draft Solar
16 PEIS), a programmatic design feature has been included under Recreation (Section A.2.2.6.1 of
17 Appendix A) that requires consideration of replacement of lost OHV route acreage and of access
18 across and to public lands.
19
20

21 **13.3.21.3 SEZ-Specific Design Features and Design Feature Effectiveness**
22

23 Required programmatic design features that would reduce transportation impacts are
24 described in Section A.2.2 of Appendix A of this Final Solar PEIS. The programmatic design
25 features, including local road improvements, multiple site access locations, staggered work
26 schedules, and ride-sharing, would all provide some relief to traffic congestion on local roads
27 leading to the SEZ. Depending on the location of solar facilities within the SEZ, more specific
28 access locations and local road improvements could be implemented.
29

30 On the basis of impact analyses conducted for the Draft Solar PEIS and consideration of
31 comments received as applicable, no SEZ-specific design features to address transportation
32 impacts have been identified. Some SEZ-specific design features may be identified through the
33 process of preparing parcels for competitive offer and subsequent project-specific analysis.
34
35

36 **13.3.22 Cumulative Impacts**
37

38 The analysis of potential impacts in the vicinity of the proposed Wah Wah Valley SEZ
39 presented in the Draft Solar PEIS is still generally applicable for this Final Solar PEIS. The size
40 of the developable area of the proposed SEZ has been reduced by less than 4%. The following
41 sections include an update to the information presented in the Draft Solar PEIS regarding
42 cumulative effects for the proposed Wah Wah Valley SEZ.
43
44
45

1 **13.3.22.1 Geographic Extent of the Cumulative Impact Analysis**
2

3 The geographic extent of the cumulative impact analysis has not changed. The extent
4 varies on the basis of the nature of the resource being evaluated and the distance at which the
5 impacts may occur (e.g., air quality impacts may have a greater geographic extent than visual
6 resources impacts). Most of the lands around the SEZ are state owned, administered by the
7 USFS, or administered by the BLM. The BLM administers approximately 75% of the lands
8 within a 50-mi (80-km) radius of the SEZ.
9

10
11 **13.3.22.2 Overview of Ongoing and Reasonably Foreseeable Future Actions**
12

13 The Draft Solar PEIS included two other proposed SEZs in Southwestern Utah, Escalante
14 Valley and Milford Flats South; these areas remain proposed as SEZs.
15

16
17 ***13.3.22.2.1 Energy Production and Distribution***
18

19 The list of reasonably foreseeable future actions related to energy production and
20 distribution near the proposed Wah Wah Valley SEZ has been updated and is presented in
21 Table 13.3.22.2-1. The locations of these projects are shown in Figure 13.3.22.2-1. All these
22 projects were described in the Draft Solar PEIS.
23

24
25 ***13.3.22.2.2 Other Actions***
26

27 Only two of the major ongoing and foreseeable actions within 50 mi (80 km) of the
28 proposed Wah Wah Valley SEZ listed in Table 13.3.22.2-3 of the Draft Solar PEIS have had a
29 change in their status: Utah’s Copper King Mining has filed for Chapter 11 and suspended
30 operations at the Hidden Treasure Mine (Oberbeck 2010), and the Environmental Assessment
31 on the Hamlin Valley Resource Protection and Habitat Improvement Project was issued on
32 February 2, 2012 (BLM 2012b).
33

34
35 **13.3.22.3 General Trends**
36

37 The information on general trends presented in the Draft Solar PEIS remains valid.
38
39

40 **13.3.22.4 Cumulative Impacts on Resources**
41

42 Total disturbance in the proposed Wah Wah Valley SEZ over 20 years is assumed to be
43 up to about 4,698 acres (19.0 km²) (80% of the entire proposed SEZ). This development would
44 contribute incrementally to the impacts from other past, present, and reasonably foreseeable
45 future actions in the region as described in the Draft Solar PEIS. Primary impacts from
46 development in the Wah Wah Valley SEZ may include impacts on water quantity and quality, air

1

2

3 quality, ecological resources such as habitat and species, cultural and visual resources, and
4 specially designated lands.

5

6 No additional major actions have been identified within 50 mi (80 km) of the SEZ. The
7 incremental cumulative impacts associated with development in the proposed Wah Wah Valley
8 SEZ during construction, operation, and decommissioning are expected to be the same as those
9 projected in the Draft Solar PEIS.

10

11

12 **13.3.23 Transmission Analysis**

13

14 The methodology for this transmission analysis is described in Appendix G of this Final
15 Solar PEIS. This section presents the results of the transmission analysis for the Wah Wah
16 Valley SEZ, including the identification of potential load areas to be served by power generated
17 at the SEZ and the results of the DLT analysis. Unlike Sections 13.3.2 through 13.3.22, this
18 section is not an update of previous analysis for the Wah Wah Valley SEZ; this analysis was not
19 presented in the Draft Solar PEIS. However, the methodology and a test case analysis were
20 presented in the Supplement to the Draft Solar PEIS. Comments received on the material

FIGURE 13.3.22.2-1 Locations of Existing and Reasonably Foreseeable Renewable Energy Projects on Public Land within a 50-mi (80-km) Radius of the Proposed Wah Wah Valley SEZ as Revised

1 presented in the Supplement were used to improve the methodology for the assessment presented
2 in this Final Solar PEIS.

3
4 On the basis of its size, the assumption of a minimum of 5 acres (0,02 km²) of land
5 required per MW, and the assumption of a maximum of 80% of the land area developed, the
6 Wah Wah Valley SEZ is estimated to have the potential to generate 940 MW of marketable solar
7 power at full build-out.

8 9 10 **13.3.23.1 Identification and Characterization of Load Areas**

11
12 The primary candidates for Wah Wah Valley SEZ load areas are the major surrounding
13 cities. Figure 13.3.23.1-1 shows the possible load areas for the Wah Wah Valley SEZ and the
14 estimated portion of their market that could be served by solar generation. Possible load areas for
15 the Wah Wah Valley SEZ include St. George and Salt Lake City, Utah; Las Vegas, Nevada; and
16 the major cities in San Bernardino and Riverside Counties, California.

17
18 The two load area groups examined for the Wah Wah Valley SEZ are as follows:

- 19
20 1. Las Vegas, Nevada; and
21
22 2. Salt Lake City, Utah; and San Bernardino–Riverside County load II and
23 San Bernardino–Riverside County load I, California.

24
25 Figure 13.3.23.1-2 shows the most economically viable load groups and transmission
26 scheme for the Wah Wah Valley SEZ (transmission scheme 1), and Figure 13.3.23.1-3 shows an
27 alternative transmission scheme (transmission scheme 2) that represents a logical choice should
28 transmission scheme 1 be infeasible. As described in Appendix G, the alternative shown in
29 transmission scheme 2 represents the optimum choice if one or more of the primary linkages in
30 transmission scheme 1 are excluded from consideration. The groups provide for linking loads
31 along alternative routes so that the SEZ's output of 940 MW could be fully allocated.

32
33 Table 13.3.23.1-1 summarizes and groups the load areas according to their associated
34 transmission scheme and provides details on how the megawatt load for each area was estimated.

35 36 37 **13.3.23.2 Findings for the DLT Analysis**

38
39 The DLT analysis approach assumes that the Wah Wah Valley SEZ will require all new
40 construction for transmission lines (i.e., dedicated lines) and substations. The new transmission
41 lines(s) would directly convey the 940-MW output of the Wah Wah Valley SEZ to the
42 prospective load areas for each possible transmission scheme. The approach also assumes that
43 all existing transmission lines in the WECC region are saturated and have little or no available
44 capacity to accommodate the SEZ's output throughout the entire 10-year study horizon.

1

2

FIGURE 13.3.23.1-1 Location of the Proposed Wah Wah Valley SEZ and Possible Load Areas (Source for background map: Platts 2011)

3

4

5

6

Figures 13.3.23.1-2 and 13.3.23.1-3 display the pathways that new dedicated lines might follow to distribute solar power generated at the Wah Wah Valley SEZ via the two identified transmission schemes described in Table 13.3.23.1-1. These pathways parallel existing 500-, 345-kV, and/or lower voltage lines. The intent of following existing lines is to avoid pathways that may be infeasible due to topographical limitations or other concerns.

7

8

9

10

11

12

For transmission scheme 1, serving the southwest, a new line would be constructed to connect with Las Vegas, so that the 940-MW output of the Wah Wah Valley SEZ could be fully utilized (Figure 13.3.23.1-2). This particular scheme has three segments. The first segment extends to the southwest from the SEZ to the first switching station over a distance of about 29 mi (47 km). On the basis of engineering and operational considerations, this segment would require a double-circuit 345-kV (2–345 kV) bundle of two (Bof2) transmission line design. The second leg goes about 72 mi (116 km) from the first switching station to a second switching station, and the third and final segment extends about 125 mi (201 km) from the second switching station to Las Vegas. In general, the transmission configuration options were determined by using the line “loadability” curve provided in American Electric Power’s *Transmission Facts* (AEP 2010). Appendix G documents the line options used for this analysis and describes how the load area groupings were determined.

13

14

15

16

17

18

19

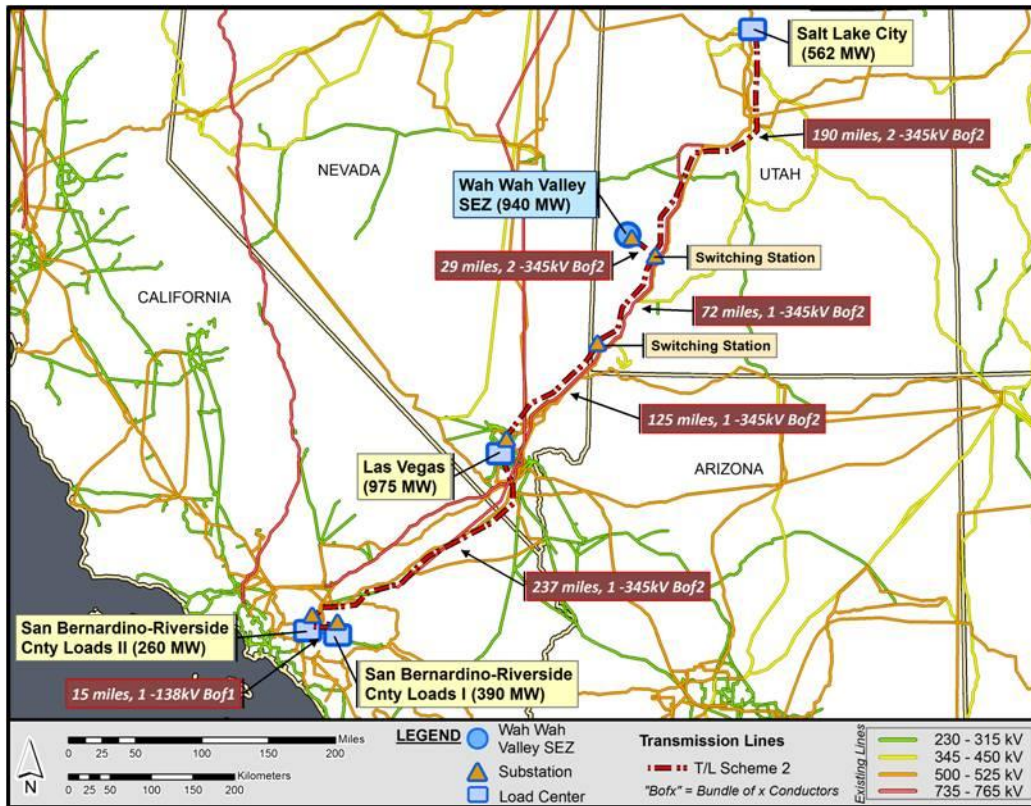

FIGURE 13.3.23.1-2 Transmission Scheme 1 for the Proposed Wah Wah Valley SEZ (Source for background map: Platts 2011)

Transmission scheme 2, which assumes the Las Vegas market is not available, serves load centers to the southwest and northwest. Figure 13.3.23.1-3 shows that new lines would be constructed to connect with Salt Lake City, San Bernardino–Riverside County load II (260 MW) and San Bernardino–Riverside County load I (562 MW), so that the 940-MW output of the Wah Wah Valley SEZ could be fully utilized. This scheme has six segments. The first segment extends to the southwest from the SEZ to the first switching station over a distance of about 29 mi (47 km). This segment would require a double-circuit 345-kV (2–345 kV) bundle of two (Bof2) transmission line design. The second leg goes about 72 mi (116 km) from the first switching station to the second switching station, and the third leg extends about 125 mi (201 km) from the second switching station to the Las Vegas switching station. The fourth segment runs from the Las Vegas switching station to the San Bernardino–Riverside County load II (260 MW) via a 237-mi (381-km) line, while the fifth leg links San Bernardino–Riverside County load II with San Bernardino–Riverside County load I (390 MW) via a 15-mi (24-km) line. The seventh leg extends to the northeast from the first switching station near the SEZ to Salt Lake City (562 MW) over a distance of 190 mi (306 km).

Table 13.3.23.2-1 summarizes the distances to the various load areas over which new transmission lines would need to be constructed, as well as the assumed number of substations that would be required. One substation is assumed to be installed at each load area and an

TABLE 13.3.23.1-1 Candidate Load Area Characteristics for the Proposed Wah Wah Valley SEZ

Transmission Scheme	City/Load Area Name	Position Relative to SEZ	2010 Population ^d	Estimated Total Peak Load (MW)	Estimated Peak Solar Market (MW)
1	Las Vegas, Nevada ^a	South	1,950,000	4,878	975
2	San Bernardino–Riverside County load II, California ^b	Southwest	520,000	1,312	260
	San Bernardino–Riverside County load I, California ^c	South	780,000	1,967	390
	Salt Lake City, Utah ^a	Northeast	1,124,000	2,810	562

^a The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).
^b The San Bernardino–Riverside County load II area includes the communities of Fontana, Ontario, and Rancho Cucamonga.
^c The San Bernardino–Riverside County load I area includes the communities of Colton, Riverside, San Bernardino, Redlands, Highland, and Rialto.
^d City and metropolitan area population data are from 2010 Census data (U.S. Bureau of the Census 2010).

7

1 **TABLE 13.3.23.2-1 Potential Transmission Schemes, Estimated Solar Markets, and Distances to**
 2 **Load Areas for the Proposed Wah Wah Valley SEZ**

Transmission Scheme	City/Load Area Name	Estimated Peak Solar Market (MW) ^d	Total Solar Market (MW)	Sequential Distance (mi) ^e	Total Distance (mi) ^e	Line Voltage (kV)	No. of Substations
1	Las Vegas, Nevada ^a	975	975	226	226	345	4
2	San Bernardino–Riverside County load II, California ^b	260	1,212	463	668	345, 138	7
	San Bernardino–Riverside County load I, California ^c	390		15			
	Salt Lake City, Utah ^a	562	190				

- ^a The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).
- ^b The San Bernardino–Riverside County load II area includes the communities of Fontana, Ontario, and Rancho Cucamonga.
- ^c The San Bernardino–Riverside County load I area includes the communities of Colton, Riverside, San Bernardino, Redlands, Highland, and Rialto.
- ^d From Table 13.3.23.1-1.
- ^e To convert mi to km, multiply by 1.6093.

3
 4
 5 additional one at the SEZ. In general, the total number of substations per scheme is simply equal
 6 to the number of load areas associated with the scheme plus one. Substations at the load areas
 7 would consist of one or more step-down transformers, while the originating substation at the
 8 SEZ would consist of several step-up transformers. The originating substation would have a
 9 rating of at least 940 MW (to match the plant’s output), while the combined load substations
 10 would have a similar total rating of 940 MW. Switching stations are introduced at appropriate
 11 junctions where there is the need to branch out to simultaneously serve two or more load areas
 12 in different locations.

13
 14 Table 13.3.23.2-2 provides an estimate of the total land area disturbed for construction
 15 of new transmission facilities under each of the schemes evaluated. The most favorable
 16 transmission scheme with respect to minimizing costs and the area disturbed would be scheme 1,
 17 which serves Las Vegas. This scheme is estimated to potentially disturb about 4,862 acres
 18 (19.7 km²) of land. The less favorable transmission scheme with respect to minimizing costs and
 19 the area disturbed would be scheme 2 (serving San Bernardino–Riverside County loads and Salt
 20 Lake City, but excluding Las Vegas). For this scheme, the construction of new transmission lines
 21 and substations is estimated to disturb a land area on the order of 14,060 acres (56.9 km²).

22
 23 Table 13.3.23.2-3 shows the estimated NPV of both transmission schemes and takes into
 24 account the cost of constructing the lines, the substations, and the projected revenue stream over
 25 the 10-year horizon. A positive NPV indicates that revenues more than offset investments. This
 26 calculation does not include the cost of producing electricity.
 27

1 **TABLE 13.3.23.2-2 Comparison of the Various Transmission Line Configurations with Respect to**
 2 **Land Use Requirements for the Proposed Wah Wah Valley SEZ**

Transmission Scheme	City/Load Area Name	Total Distance (mi) ^d	No. of Substations	Land Use (acres) ^e		
				Transmission Line	Substation	Total
1	Las Vegas, Nevada ^a	226	4	4,793.9	67.6	4,861.5
2	San Bernardino–Riverside County load II, California ^b San Bernardino–Riverside County load I, California ^c Salt Lake City, Utah ^a	668	7	13,997.0	63.2	14,060.2

- a The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).
 b The San Bernardino–Riverside County load II area includes the communities of Fontana, Ontario, and Rancho Cucamonga.
 c The San Bernardino–Riverside County load I area includes the communities of Colton, Riverside, San Bernardino, Redlands, Highland, and Rialto.
 d To convert mi to km, multiply by 1.6093.
 e To convert acres to km², multiply by 0.004047.

3
4
5
6

TABLE 13.3.23.2-3 Comparison of Potential Transmission Lines with Respect to NPV (Base Case) for the Proposed Wah Wah Valley SEZ

Transmission Scheme	City/Load Area Name	Present Value Transmission Line Cost (\$ million)	Present Value Substation Cost (\$ million)	Annual Sales Revenue (\$ million)	Present Worth of Revenue Stream (\$ million)	NPV (\$ million)
1	Las Vegas, Nevada ^a	565.0	186.1	164.7	1,271.7	664.6
2	San Bernardino–Riverside County load II, California ^b San Bernardino–Riverside County load I, California ^c Salt Lake City, Utah ^a	1,511.5	207.5	164.7	1,271.7	-301.8

- a The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).
 b The San Bernardino–Riverside County load II area includes the communities of Fontana, Ontario, and Rancho Cucamonga.
 c The San Bernardino–Riverside County load I area includes the communities of Colton, Riverside, San Bernardino, Redlands, Highland, and Rialto.

7
8

1 The most economically attractive configuration (transmission scheme 1) has the highest
 2 positive NPV and serves Las Vegas. The secondary case (transmission scheme 2), which
 3 excludes the Las Vegas market, is less economically attractive. For the assumed utilization factor
 4 of 20%, scheme 2 exhibits a negative NPV, implying that this option may not be economically
 5 viable under the current assumptions.

6
 7 Table 13.3.23.2-4 shows the effect of varying the value of the utilization factor on the
 8 NPV of the transmission schemes. The table shows that at about 30% utilization, the NPVs for
 9 both transmission schemes are positive. It also shows that as the utilization factor is increased,
 10 the economic viability of the lines increases. Utilization factors can be raised by allowing the
 11 new dedicated lines to market other power generation outputs in the region in addition to that of
 12 its associated SEZ.

13
 14 The findings of the DLT analysis for the proposed Wah Wah Valley SEZ are as follows:

- 15 • Transmission scheme 1, which identifies Las Vegas as the primary market,
 16 represents the most favorable option based on NPV and land use
 17 requirements. This configuration would result in new land disturbance of
 18 about 4,862 acres (19.7 km²).
- 19 • Transmission scheme 2, which represents an alternative configuration if
 20 Las Vegas is excluded, serves the major cities in San Bernardino and
 21 Riverside Counties and Salt Lake City. This configuration would result
 22 in new land disturbance of about 14,060 acres (56.9 km²).

23
 24
 25
 26
 27 **TABLE 13.3.23.2-4 Effect of Varying the Utilization Factor on the NPV of the Transmission**
 28 **Schemes for the Proposed Wah Wah Valley SEZ**

Transmission Scheme	City/Load Area Name	NPV (\$ million) at Different Utilization Factors					
		20%	30%	40%	50%	60%	70%
1	Las Vegas, Nevada ^a	644.6	1,280.5	1,916.3	2,552.2	3,188.0	3,823.8
2	San Bernardino–Riverside County load II, California ^b	-301.8	334.0	969.8	1,605.7	2,241.5	2,877.4
	San Bernardino–Riverside County load I, California ^c						
	Salt Lake City, Utah ^a						

^a The load area represents the metropolitan area (i.e., the identified city plus adjacent communities).

^b The San Bernardino–Riverside County load II area includes the communities of Fontana, Ontario, and Rancho Cucamonga.

^c The San Bernardino–Riverside County load I area includes the communities of Colton, Riverside, San Bernardino, Redlands, Highland, and Rialto.

- Other load area configurations are possible but would be less favorable than scheme 1 in terms of NPV and, in most cases, also in terms of land use requirements. If new electricity generation at the proposed Wah Wah Valley SEZ is not sent to either of the two markets identified above, the potential upper-bound impacts in terms of cost would be greater.
- The analysis of transmission requirements for the proposed Wah Wah Valley SEZ indicates no reduction of impacts from increasing the solar-eligible load assumption for transmission scheme 1, which brings power to St. George. Increasing the solar-eligible percentage would have no effect, because an adequate load area was identified under the 20% assumption that would accommodate all of the SEZ's capacity. Thus, line distances and voltages would not be affected by increasing the solar-eligible load assumption, and similarly the associated costs and land disturbance would not be affected. However, for transmission scheme 2, which serves the major cities in San Bernardino and Riverside Counties and Salt Lake City, increasing the assumed solar-eligible load assumption could result in lower cost and land disturbance estimates, because it is possible that fewer load areas would be needed to accommodate the SEZ's capacity.

13.3.24 Impacts of the Withdrawal

The BLM is proposing to withdraw 6,097 acres (25 km²) of public land comprising the proposed Wah Wah Valley SEZ from settlement, sale, location, or entry under the general land laws, including the mining laws, for a period of 20 years (see Section 2.2.2.2.4 of the Final Solar PEIS). The public lands would be withdrawn, subject to valid existing rights, from settlement, sale, location, or entry under the general land laws, including the mining laws. This means that the lands could not be appropriated, sold, or exchanged during the term of the withdrawal, and new mining claims could not be filed on the withdrawn lands. Mining claims filed prior to the segregation or withdrawal of the identified lands would take precedence over future solar energy development. The withdrawn lands would remain open to the mineral leasing, geothermal leasing, and mineral material laws, and the BLM could elect to lease the oil, gas, coal, or geothermal steam resources, or to sell common-variety mineral materials, such as sand and gravel, contained in the withdrawn lands. In addition, the BLM would retain the discretion to authorize linear and renewable energy ROWs on the withdrawn lands.

The purpose of the proposed land withdrawal is to minimize the potential for conflicts between mineral development and solar energy development for the proposed 20-year withdrawal period. Under the land withdrawal, there would be no mining-related surface development, such as the establishment of open pit mining, construction of roads for hauling materials, extraction of ores from tunnels or adits, or construction of facilities to process the material mined, that could preclude use of the SEZ for solar energy development. For the Wah Wah Valley SEZ, the impacts of the proposed withdrawal on mineral resources and related economic activity and employment are expected to be negligible because the mineral potential of the lands within the SEZ is low (BLM 2012a). There has been no documented mining with

1 the SEZ, and there are no known locatable mineral deposits within the land withdrawal area.
2 According to the LR2000 (accessed in February 2012), there are no recorded mining claims
3 within the land withdrawal area.
4

5 Although the mineral potential of the lands within the Wah Wah Valley SEZ is low, the
6 proposed withdrawal of lands within the SEZ would preclude many types of mining activity over
7 a 20-year period, resulting in the avoidance of potential mining-related adverse impacts. Impacts
8 commonly related to mining development include increased soil erosion and sedimentation,
9 water use, generation of contaminated water in need of treatment, creation of lagoons and ponds
10 (hazardous to wildlife), toxic runoff, air pollution, establishment of noxious weeds and invasive
11 species, habitat destruction or fragmentation, disturbance of wildlife, blockage of migration
12 corridors, increased visual contrast, noise, destruction of cultural artifacts and fossils and/or their
13 context, disruption of landscapes and sacred places of interest to tribes, increased traffic and
14 related emissions, and conflicts with other land uses (e.g., recreational).

2
3 This section presents corrections to material presented in the Draft Solar PEIS and the
4 Supplement to the Draft. The need for these corrections was identified in several ways: through
5 comments received on the Draft Solar PEIS and the Supplement to the Draft (and verified by the
6 authors), through new information obtained by the authors subsequent to publication of the Draft
7 Solar PEIS and the Supplement to the Draft, or through additional review of the original material
8 by the authors. Table 13.3.26-1 provides corrections to information presented in the Draft Solar
9 PEIS and the Supplement to the Draft.

10
